Feature demo · issue #166

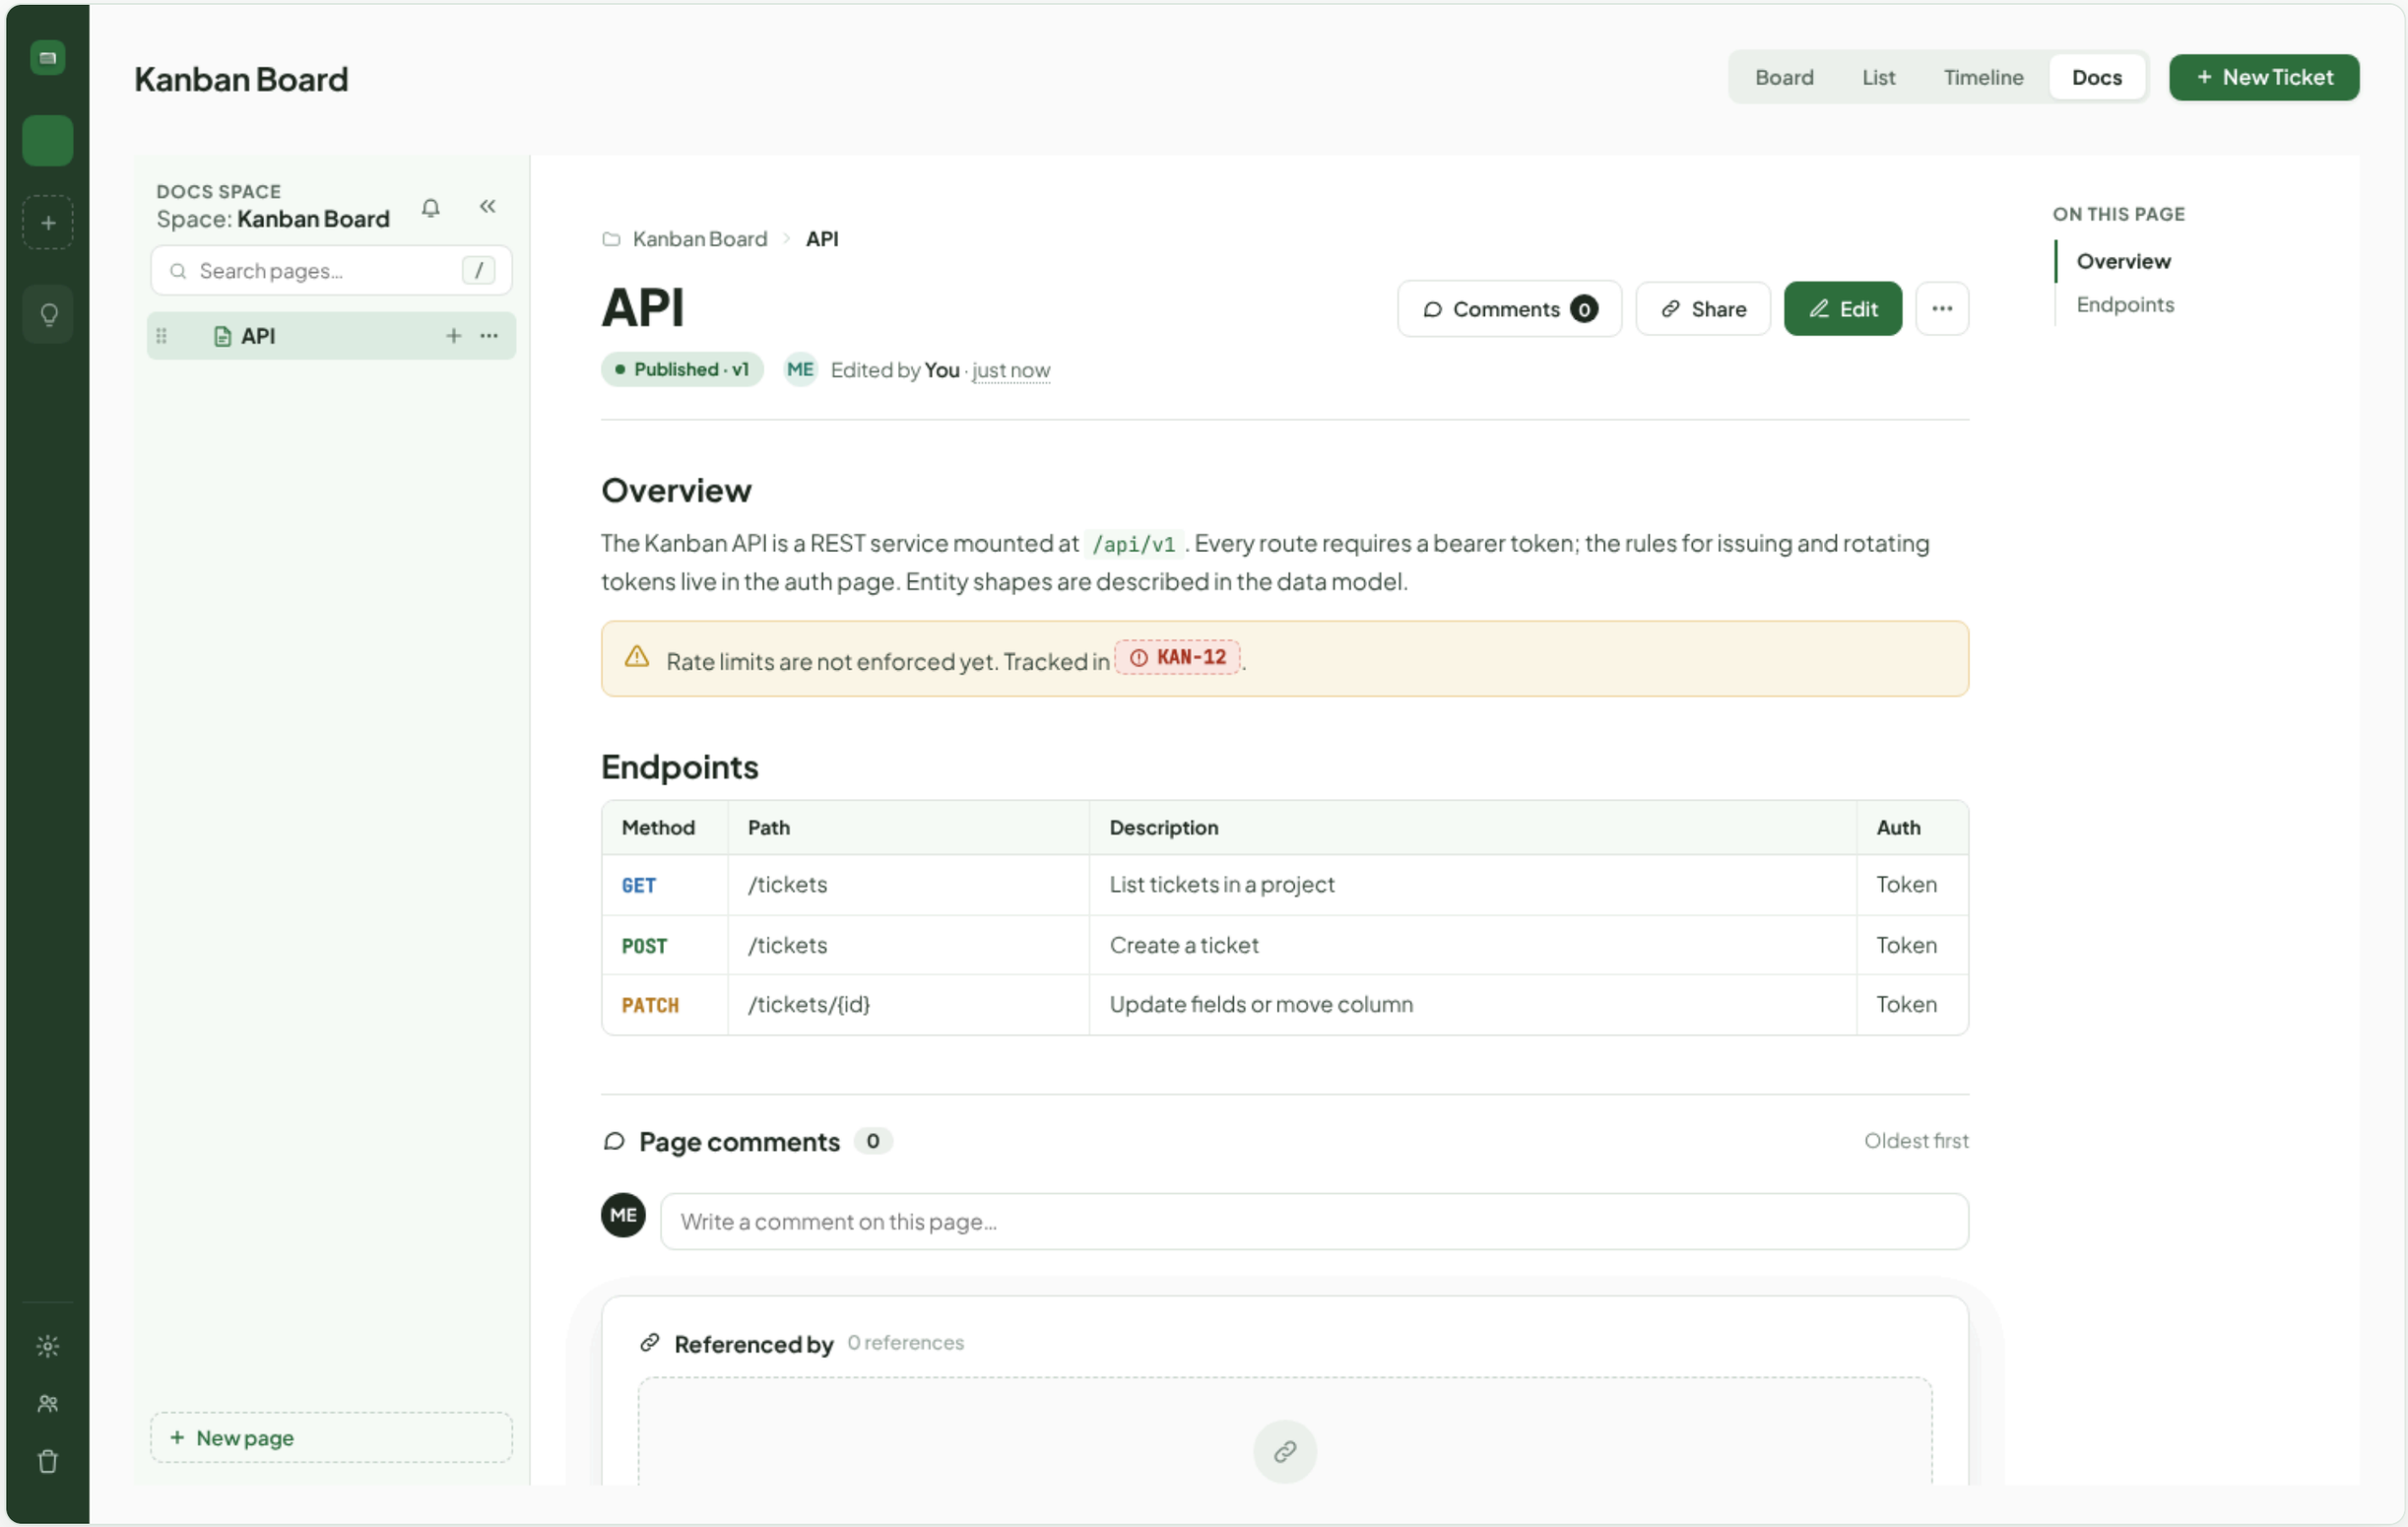

Docs comments

Inline and page comments on Docs pages — recorded from the real app (server + UI), driven by Playwright

- **Inline comments**: select text → comment; numbered highlight in the page and the editor, thread in the Inline comments panel (All / Open / Resolved).
- **Page comments** at the bottom of the page. Replies, @mentions, edit / delete own comments, resolve / reopen.
- **Anchoring**: stored as text + prefix/suffix + section; page markdown never changes. Re-matched on every publish; lost text → **orphaned** thread (re-attach or resolve); publish warning.
- **Roles**: viewer reads · member comments, replies, resolves · author edits/deletes own · admin deletes any.
- **Notifications**: mentioned people, thread starter and repliers (never the author) + Activity entries.

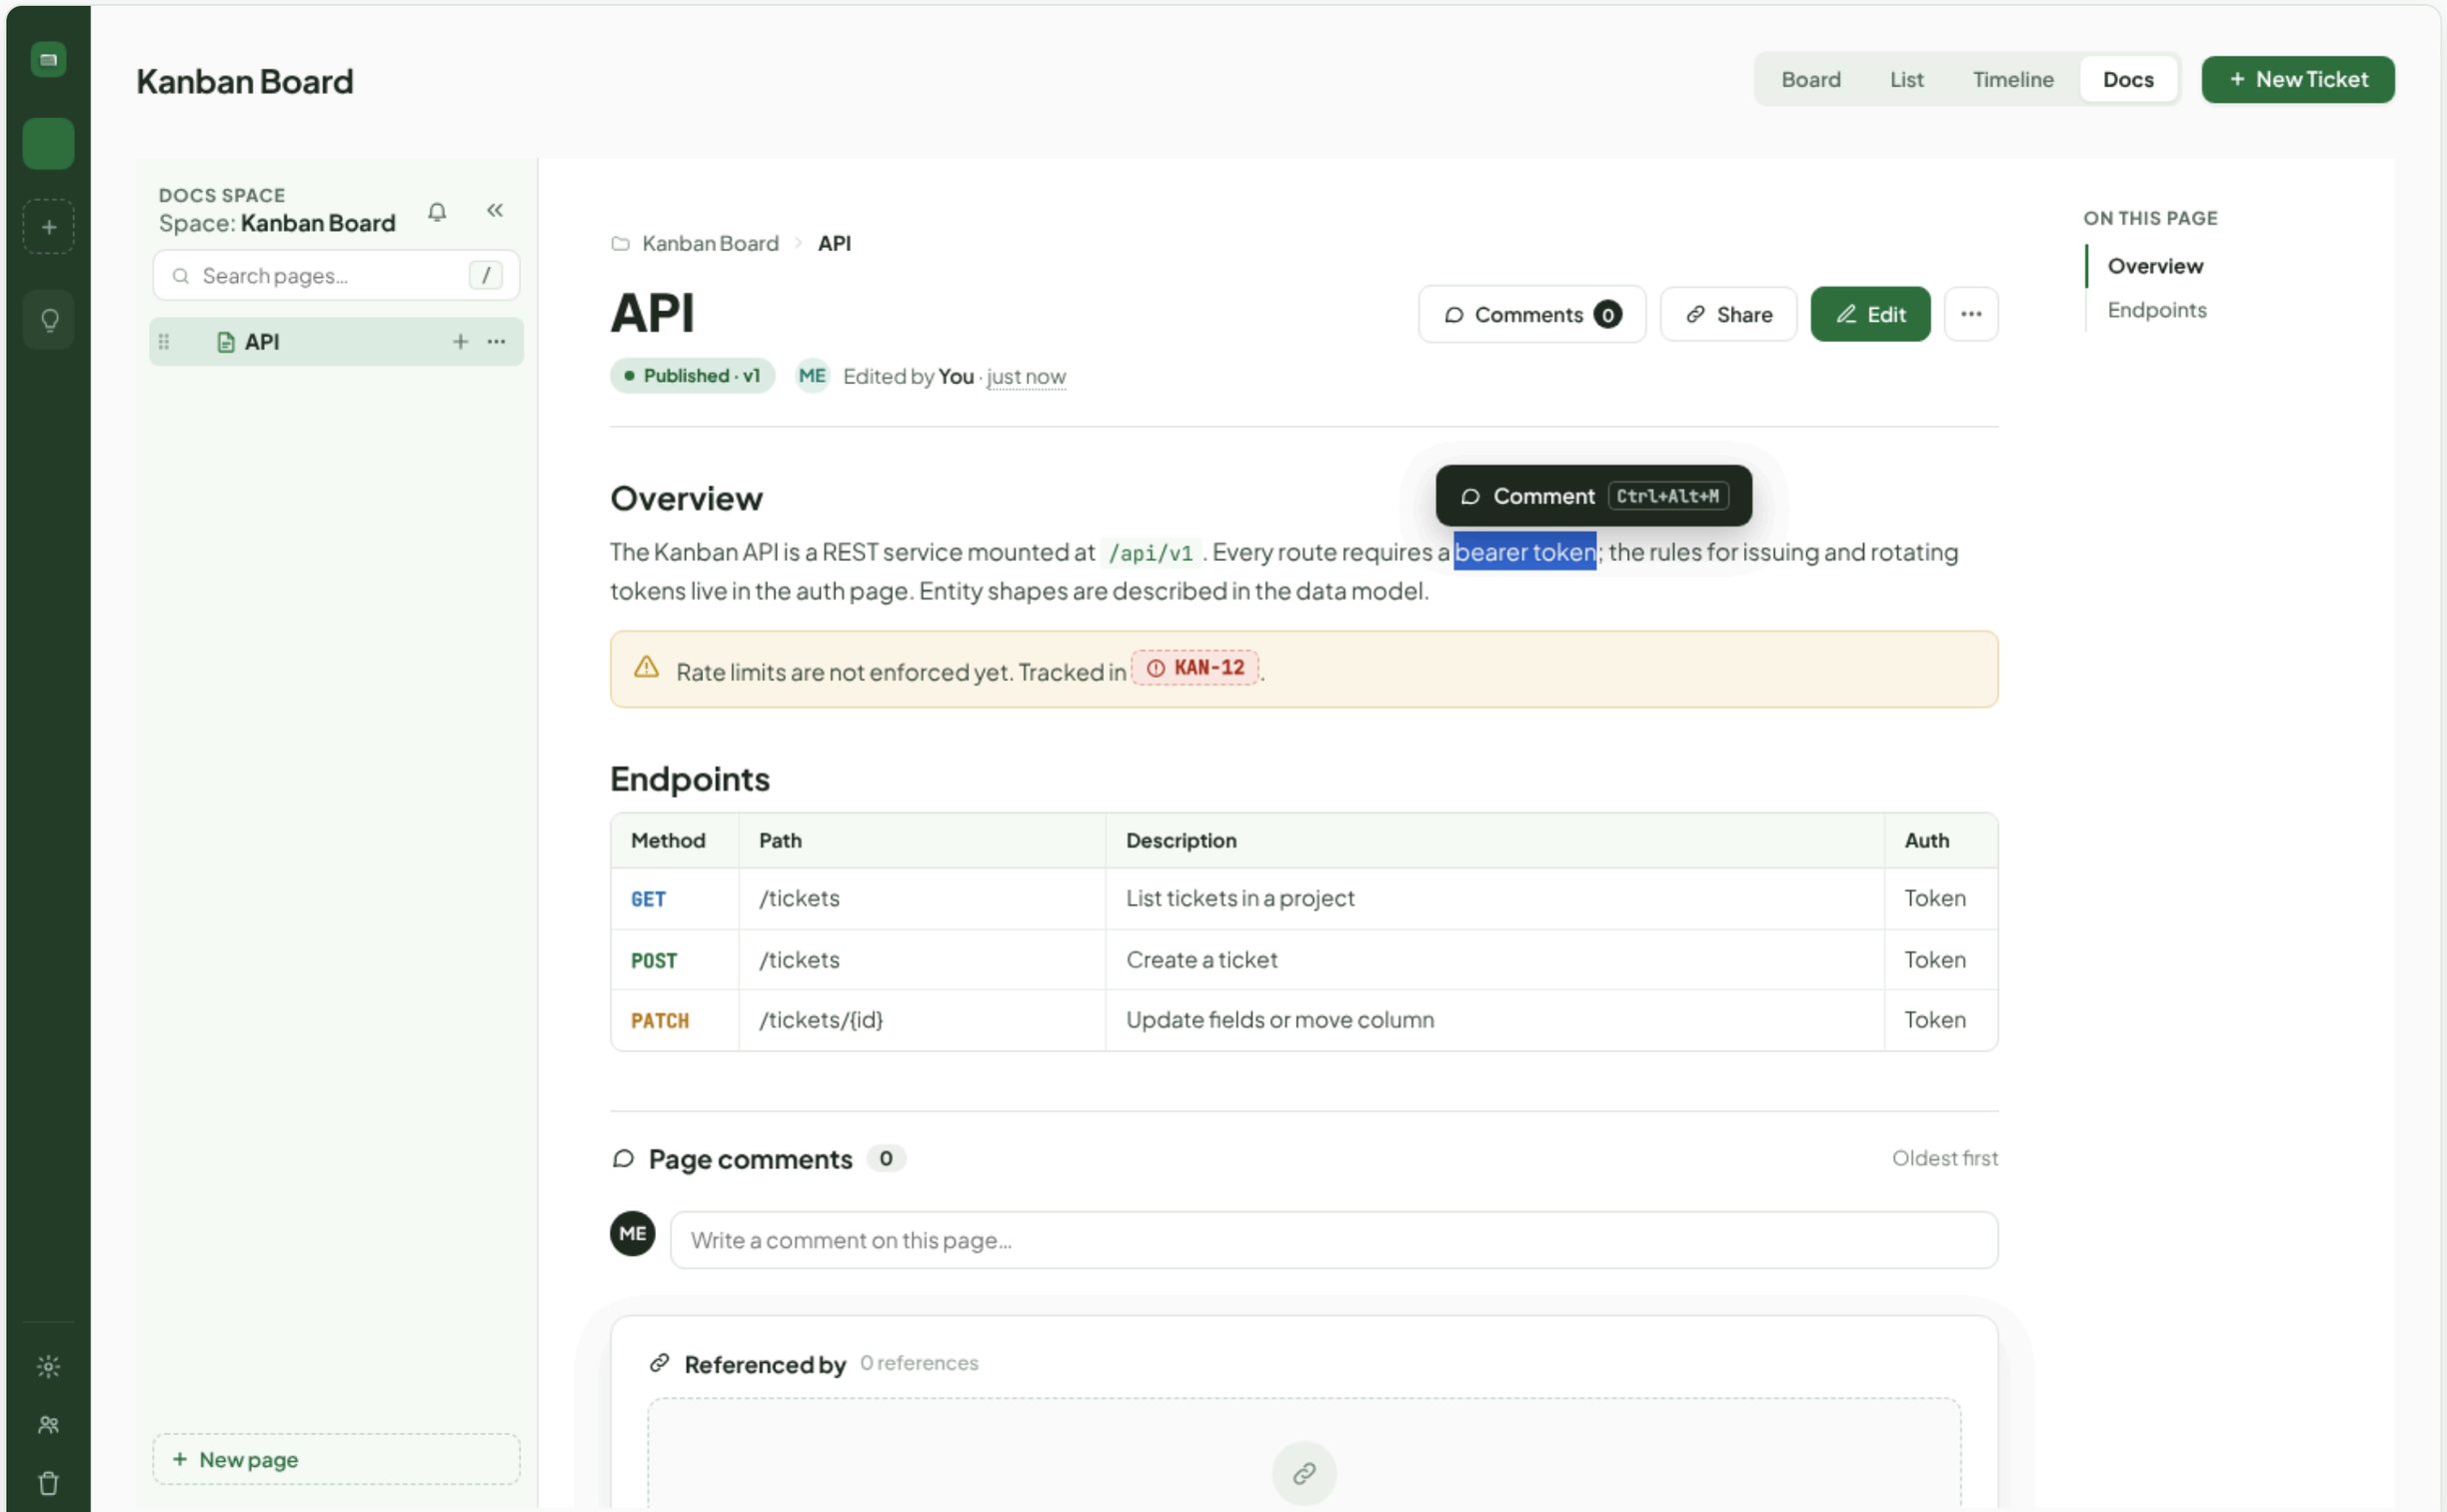

1. A published Docs page

The API page before any comment: the new Comments button (0) sits in the page header, and a Page comments section ends the page.

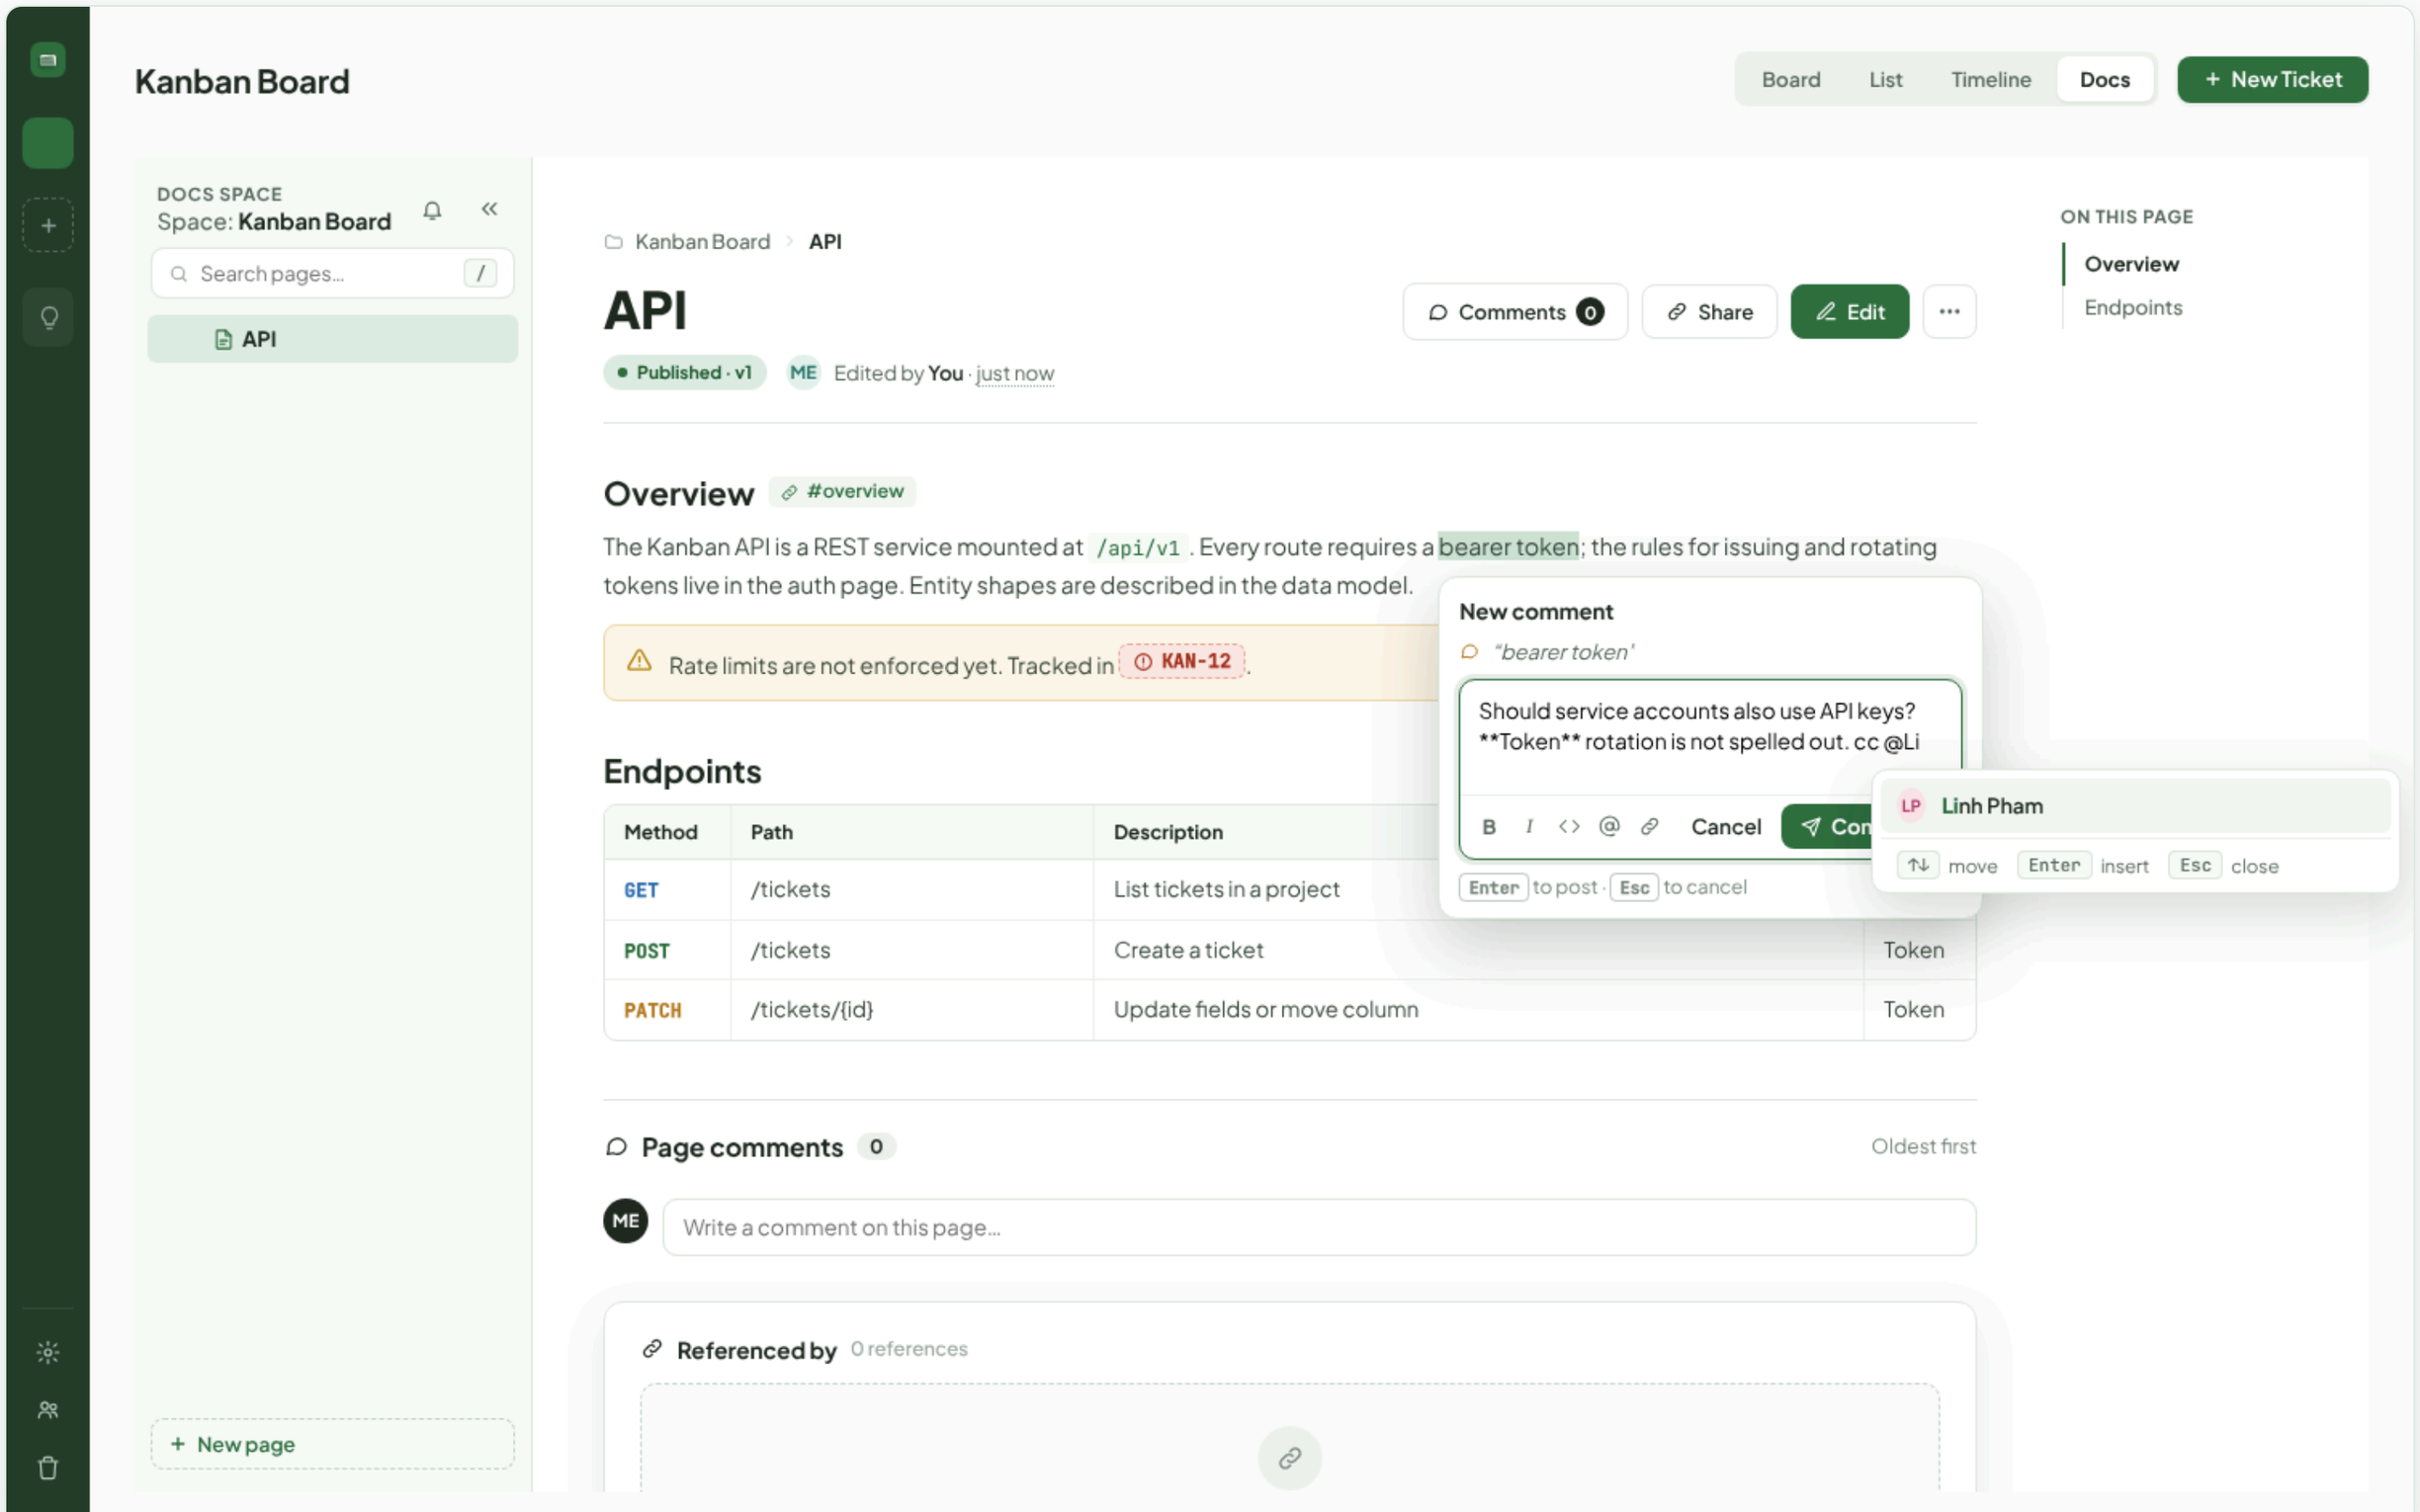

2. Select text → Comment

Selecting text inside one block shows the selection toolbar with a Comment action (shortcut Ctrl+Alt+M).

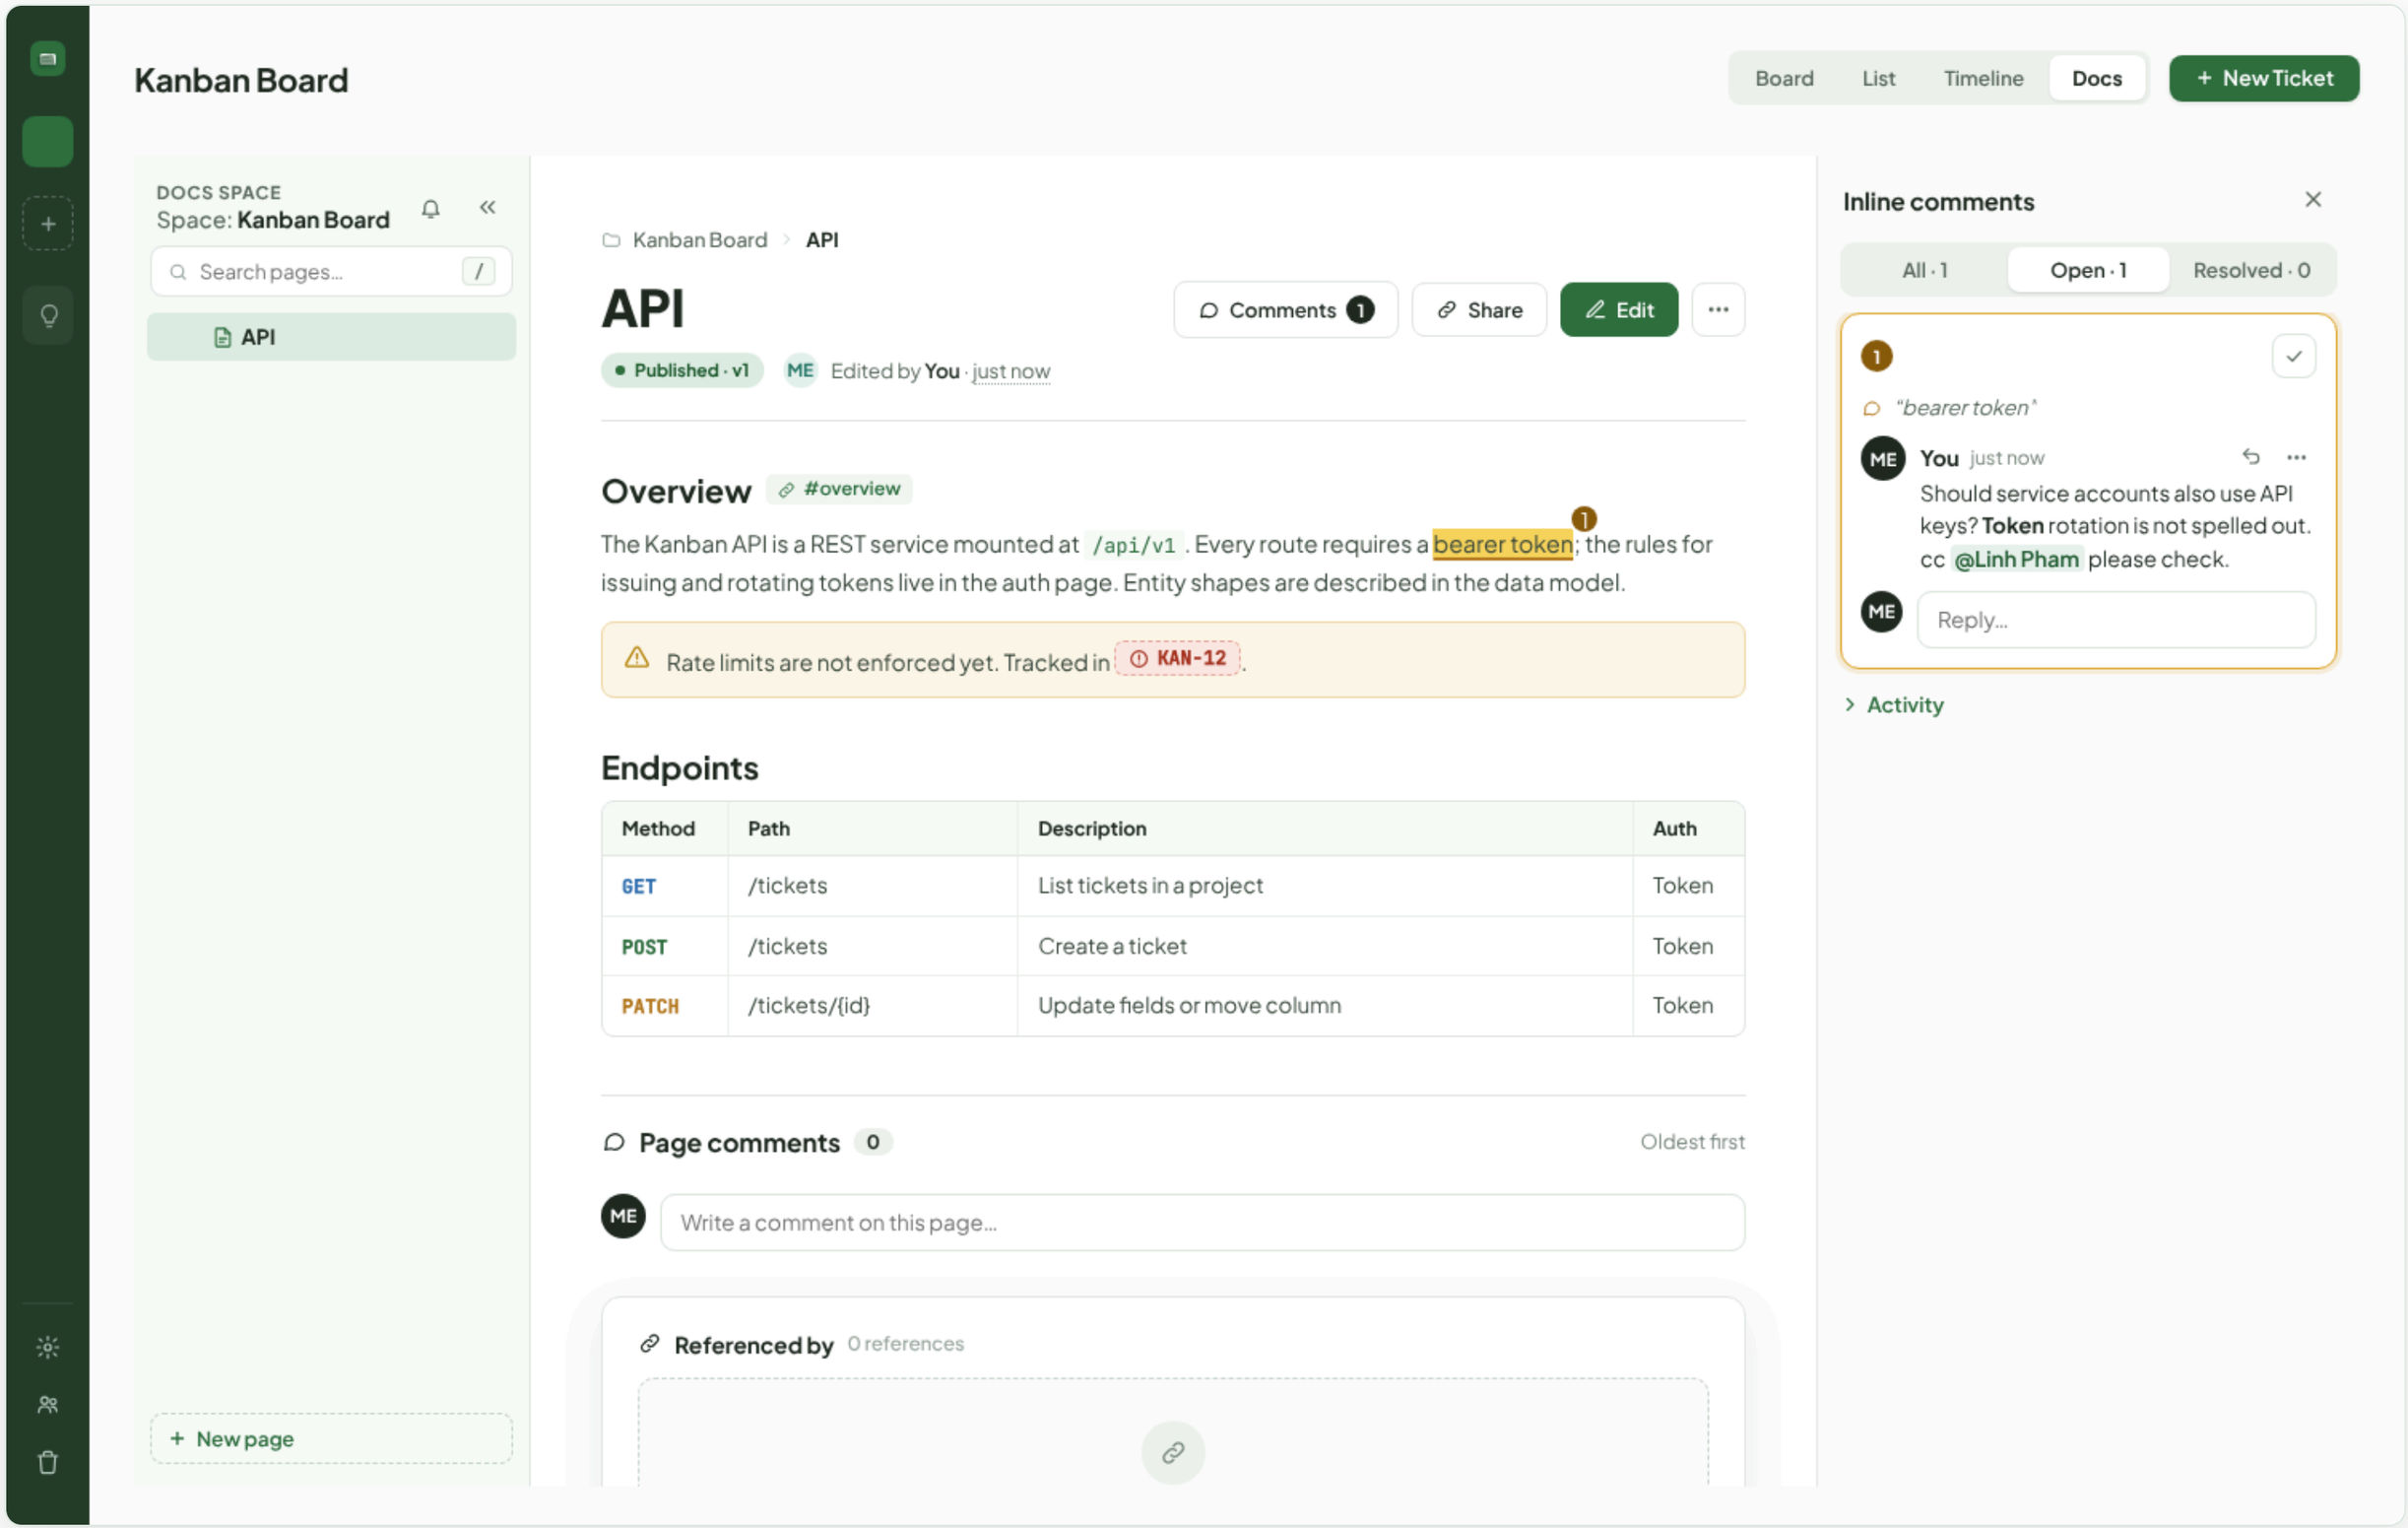

3. Composer with @mention picker

The composer opens next to the selection (the selected text stays highlighted). @ lists project members only; `[[Page]]` and ticket keys work too.

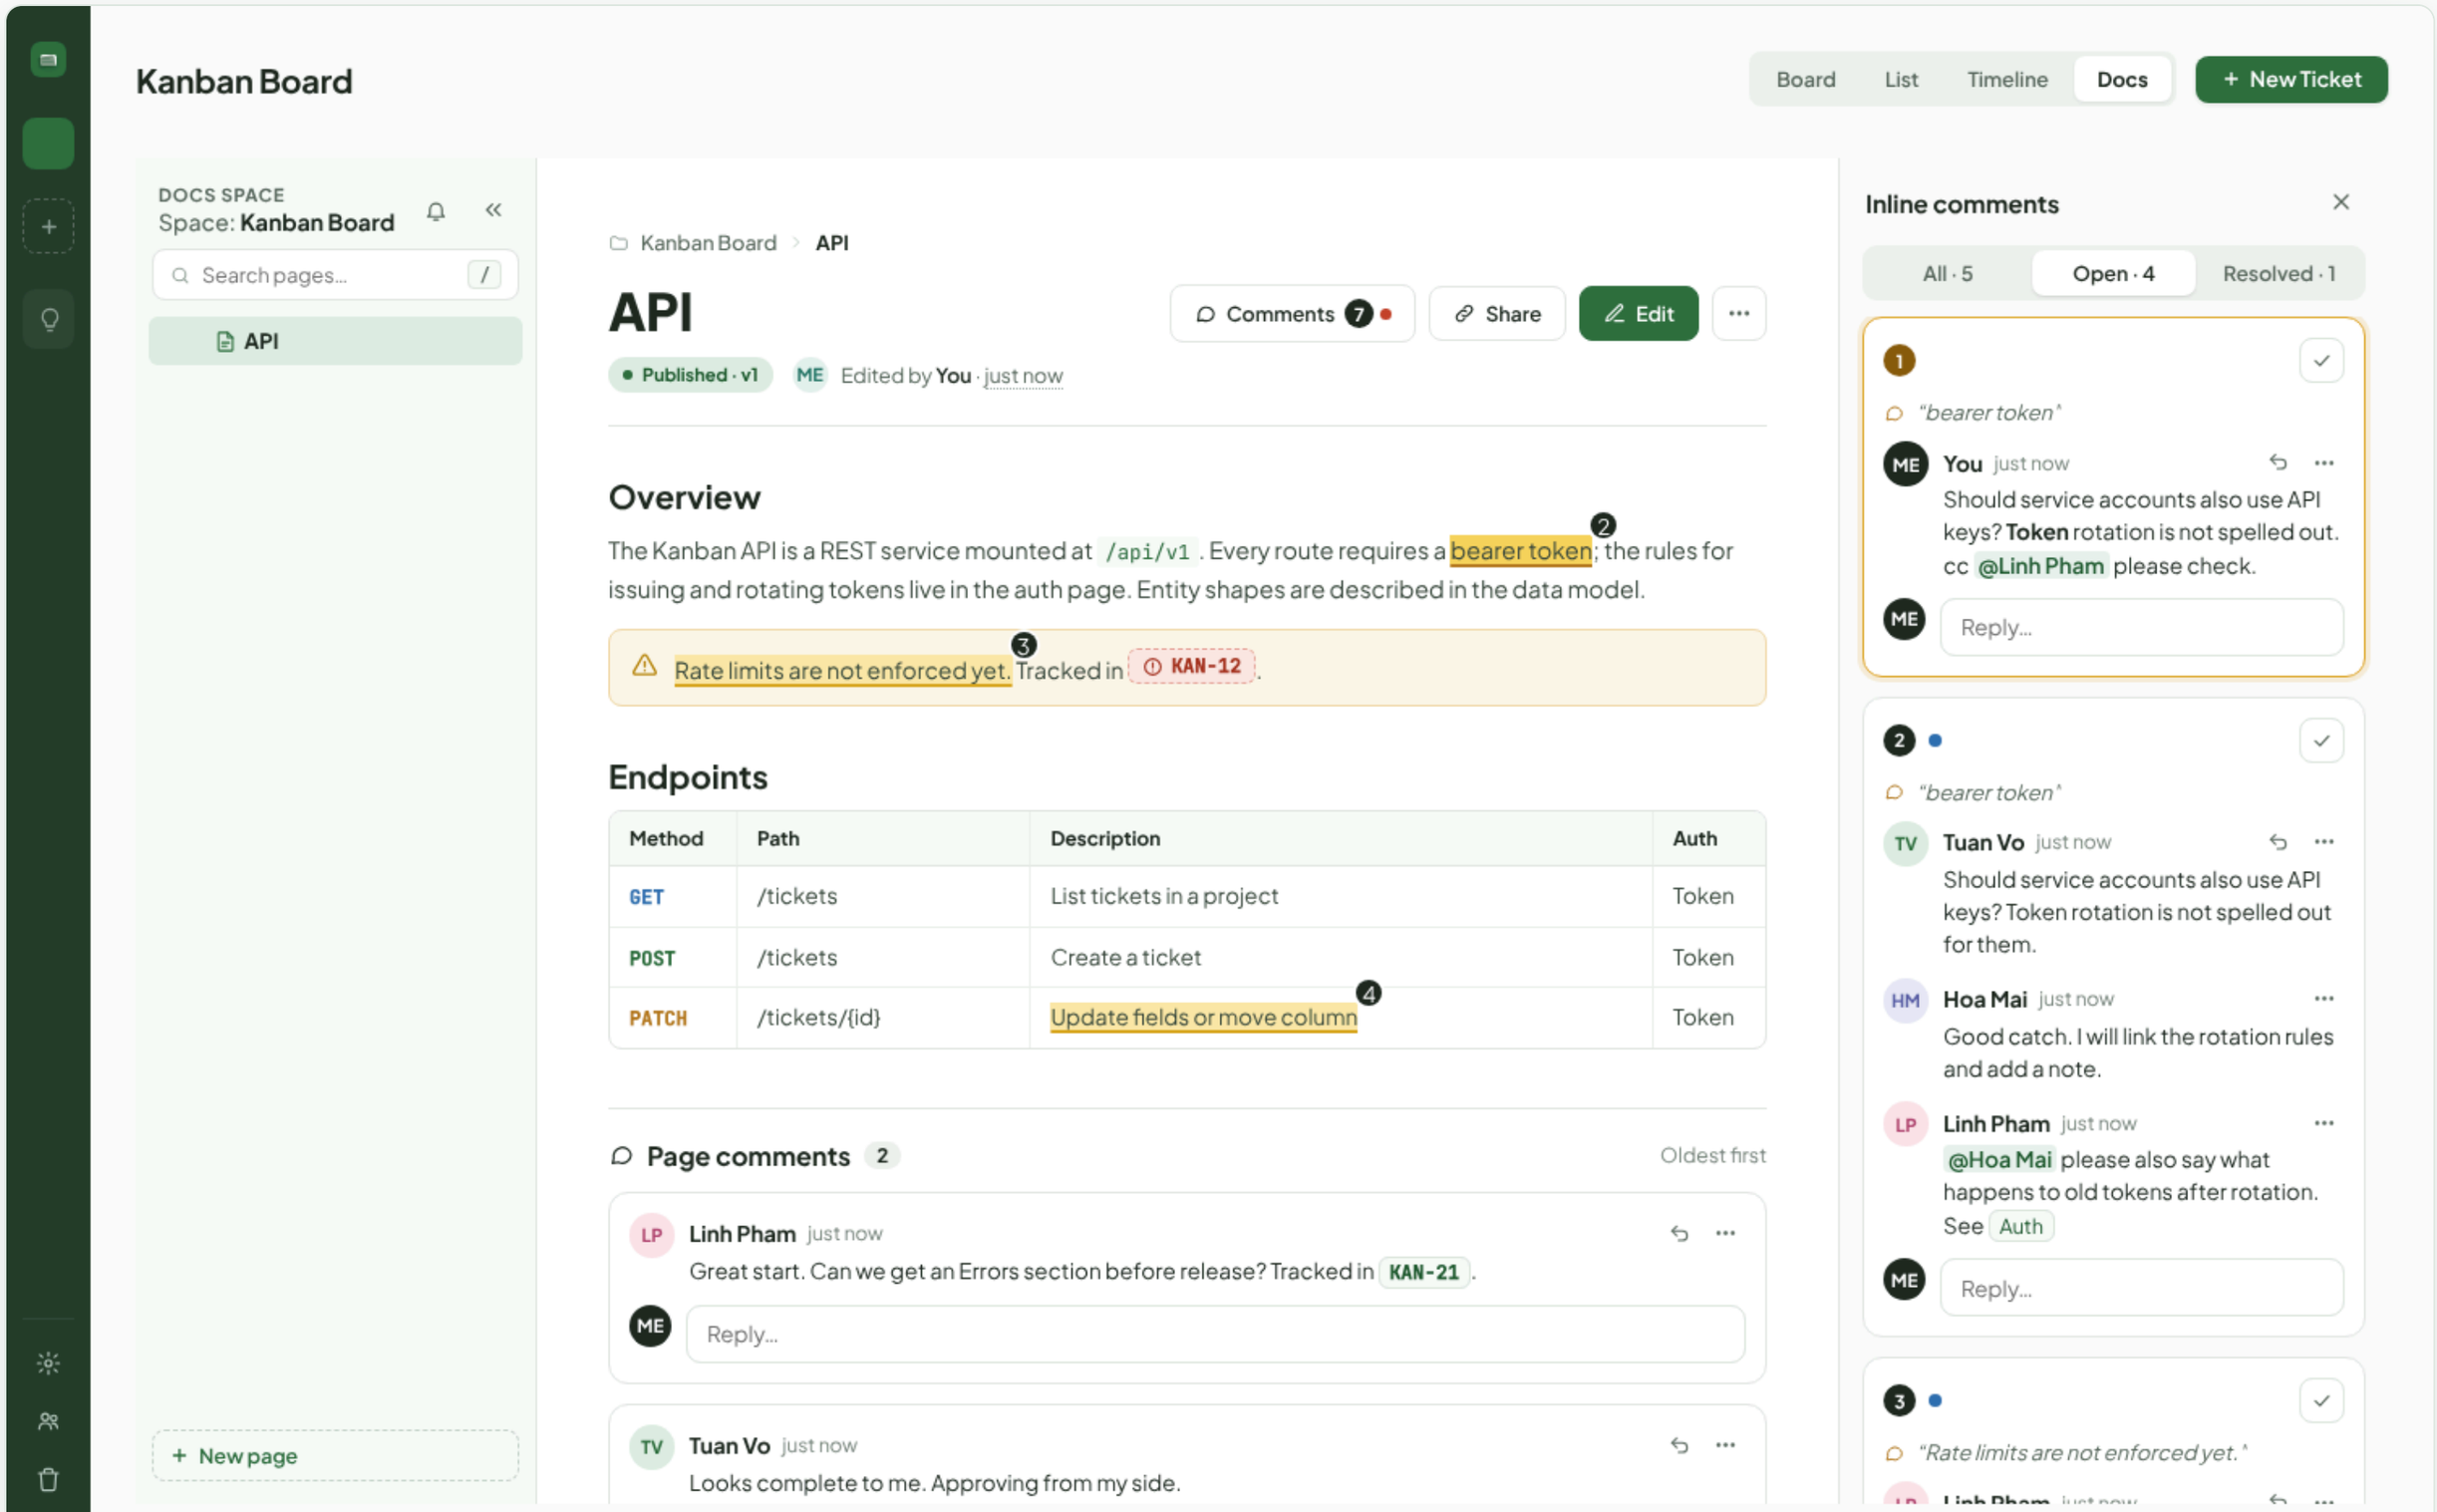

4. Posted: numbered highlight + thread in the panel

The text is highlighted with a number that matches the card in the Inline comments panel. The page markdown is not changed.

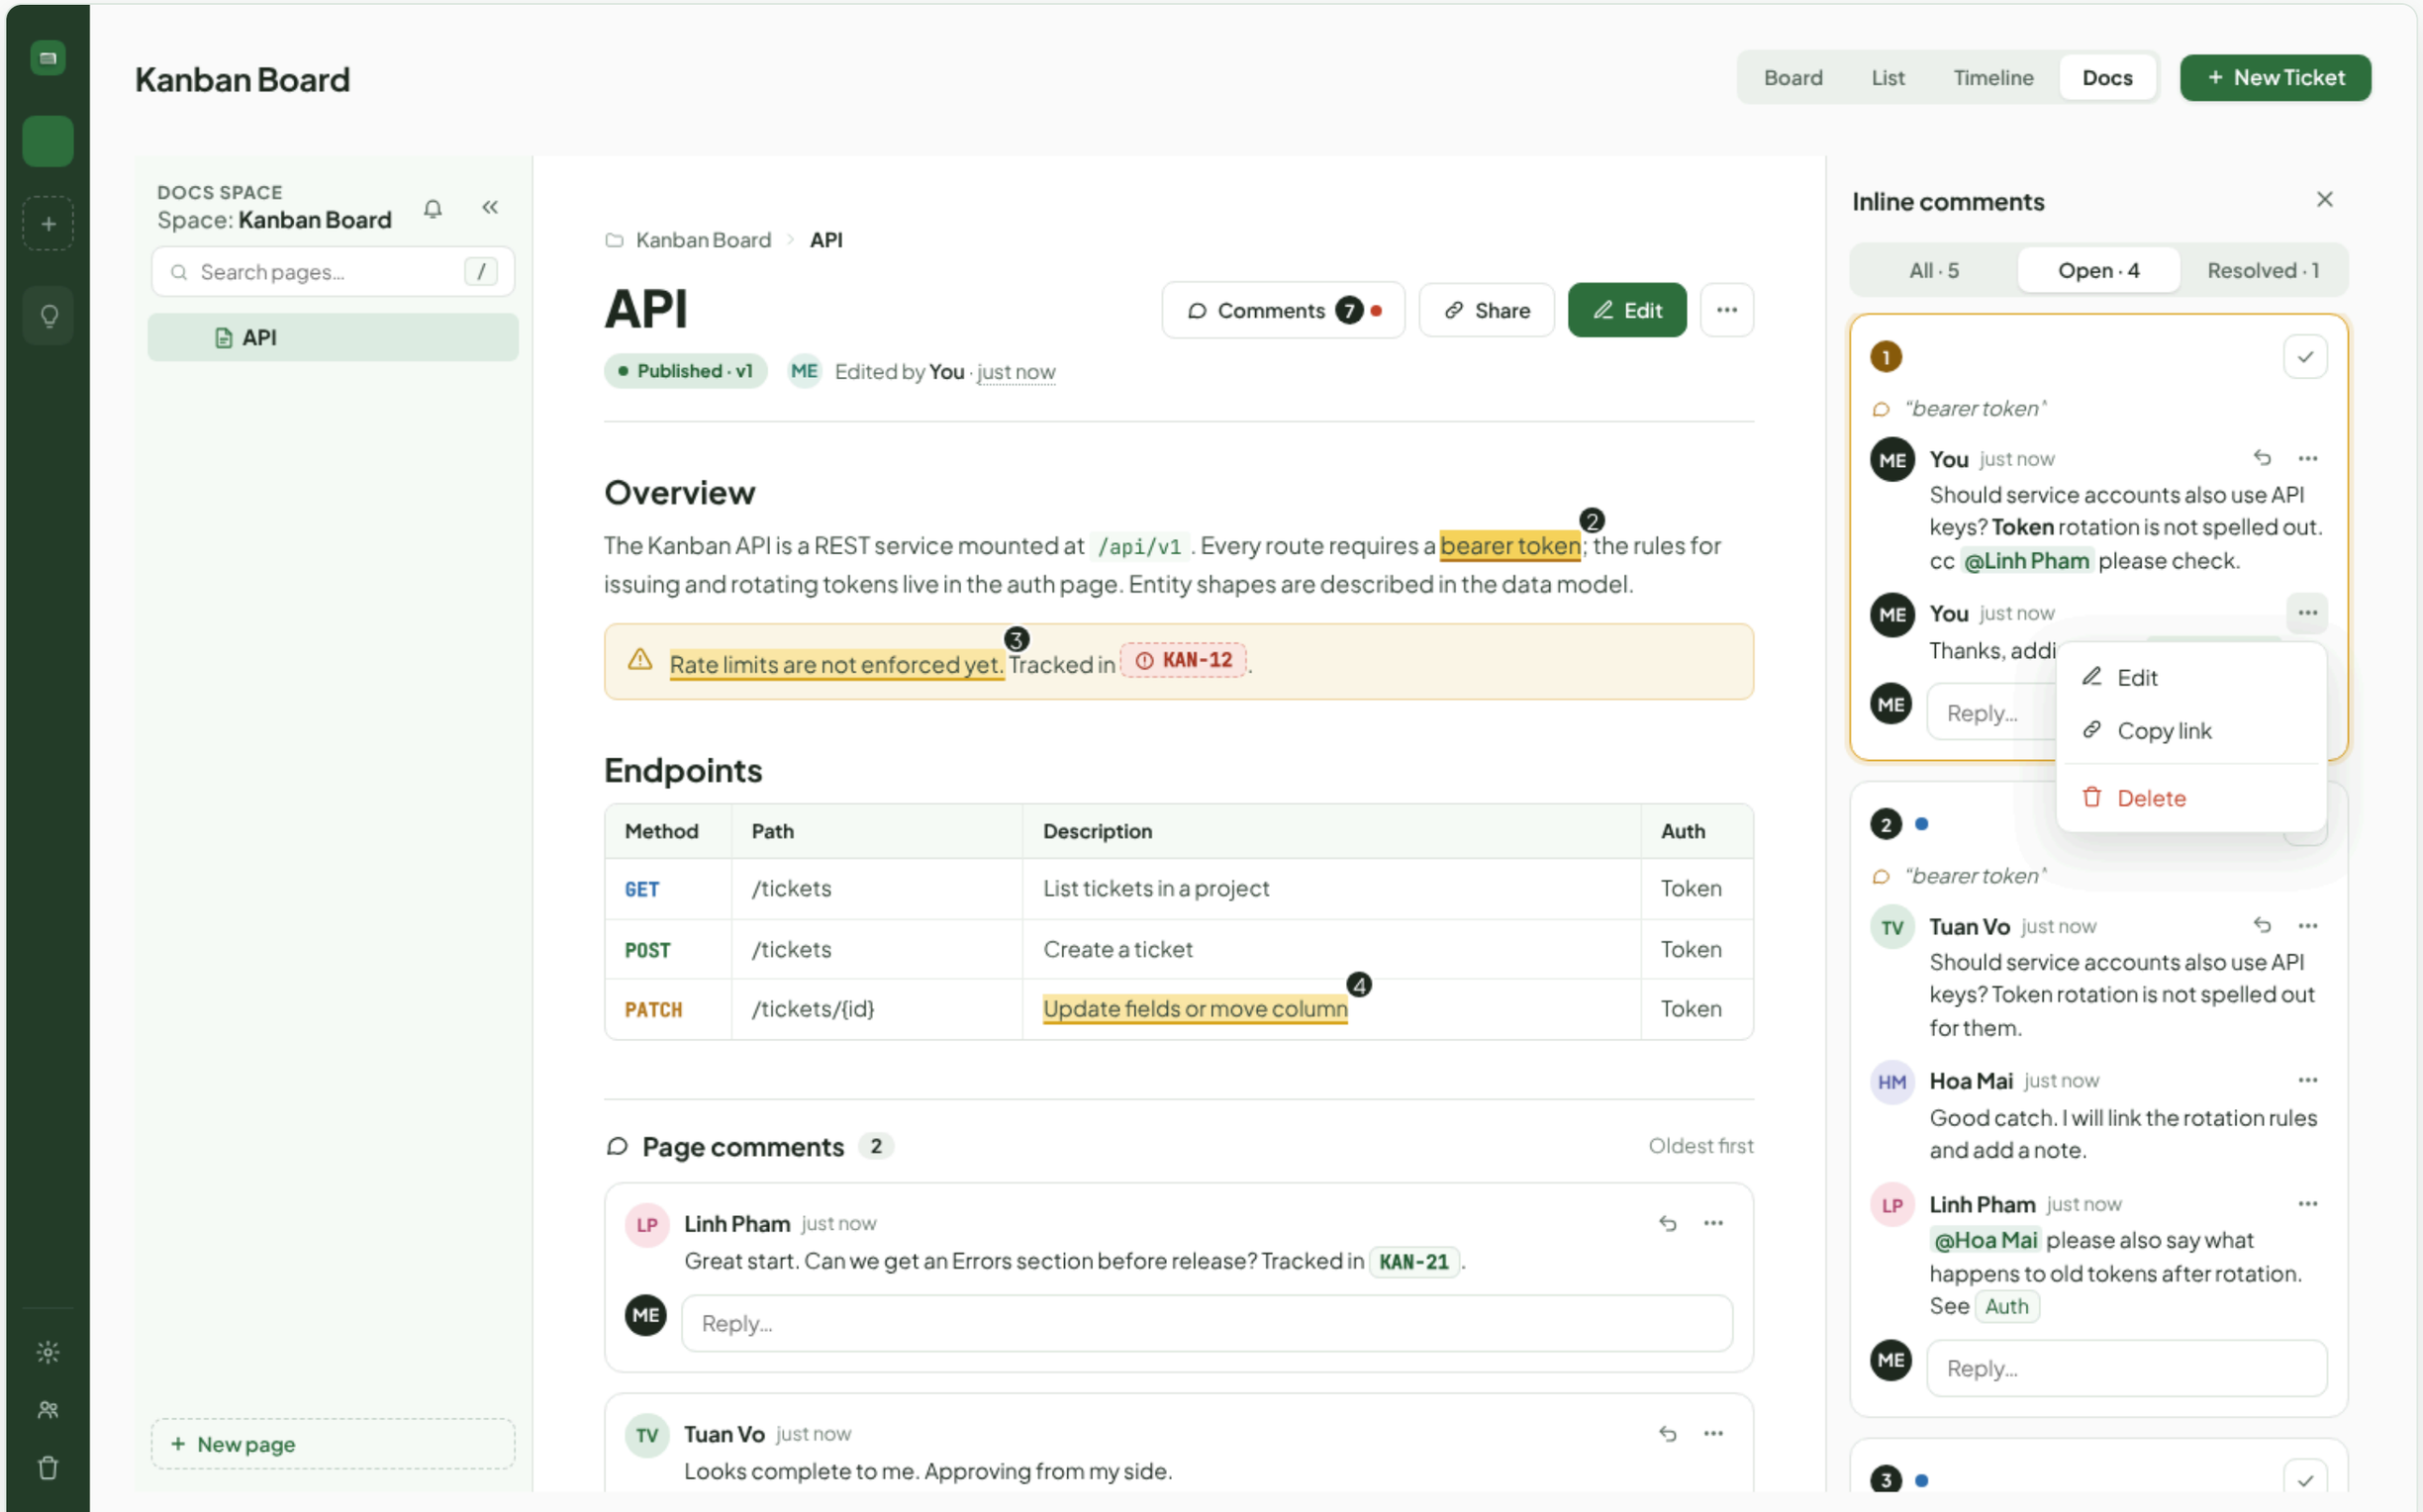

5. Panel with several threads

All · Open · Resolved tabs, numbered cards, the active thread is emphasised on both sides. Blue dots are unread threads; replies and @mentions render as chips.

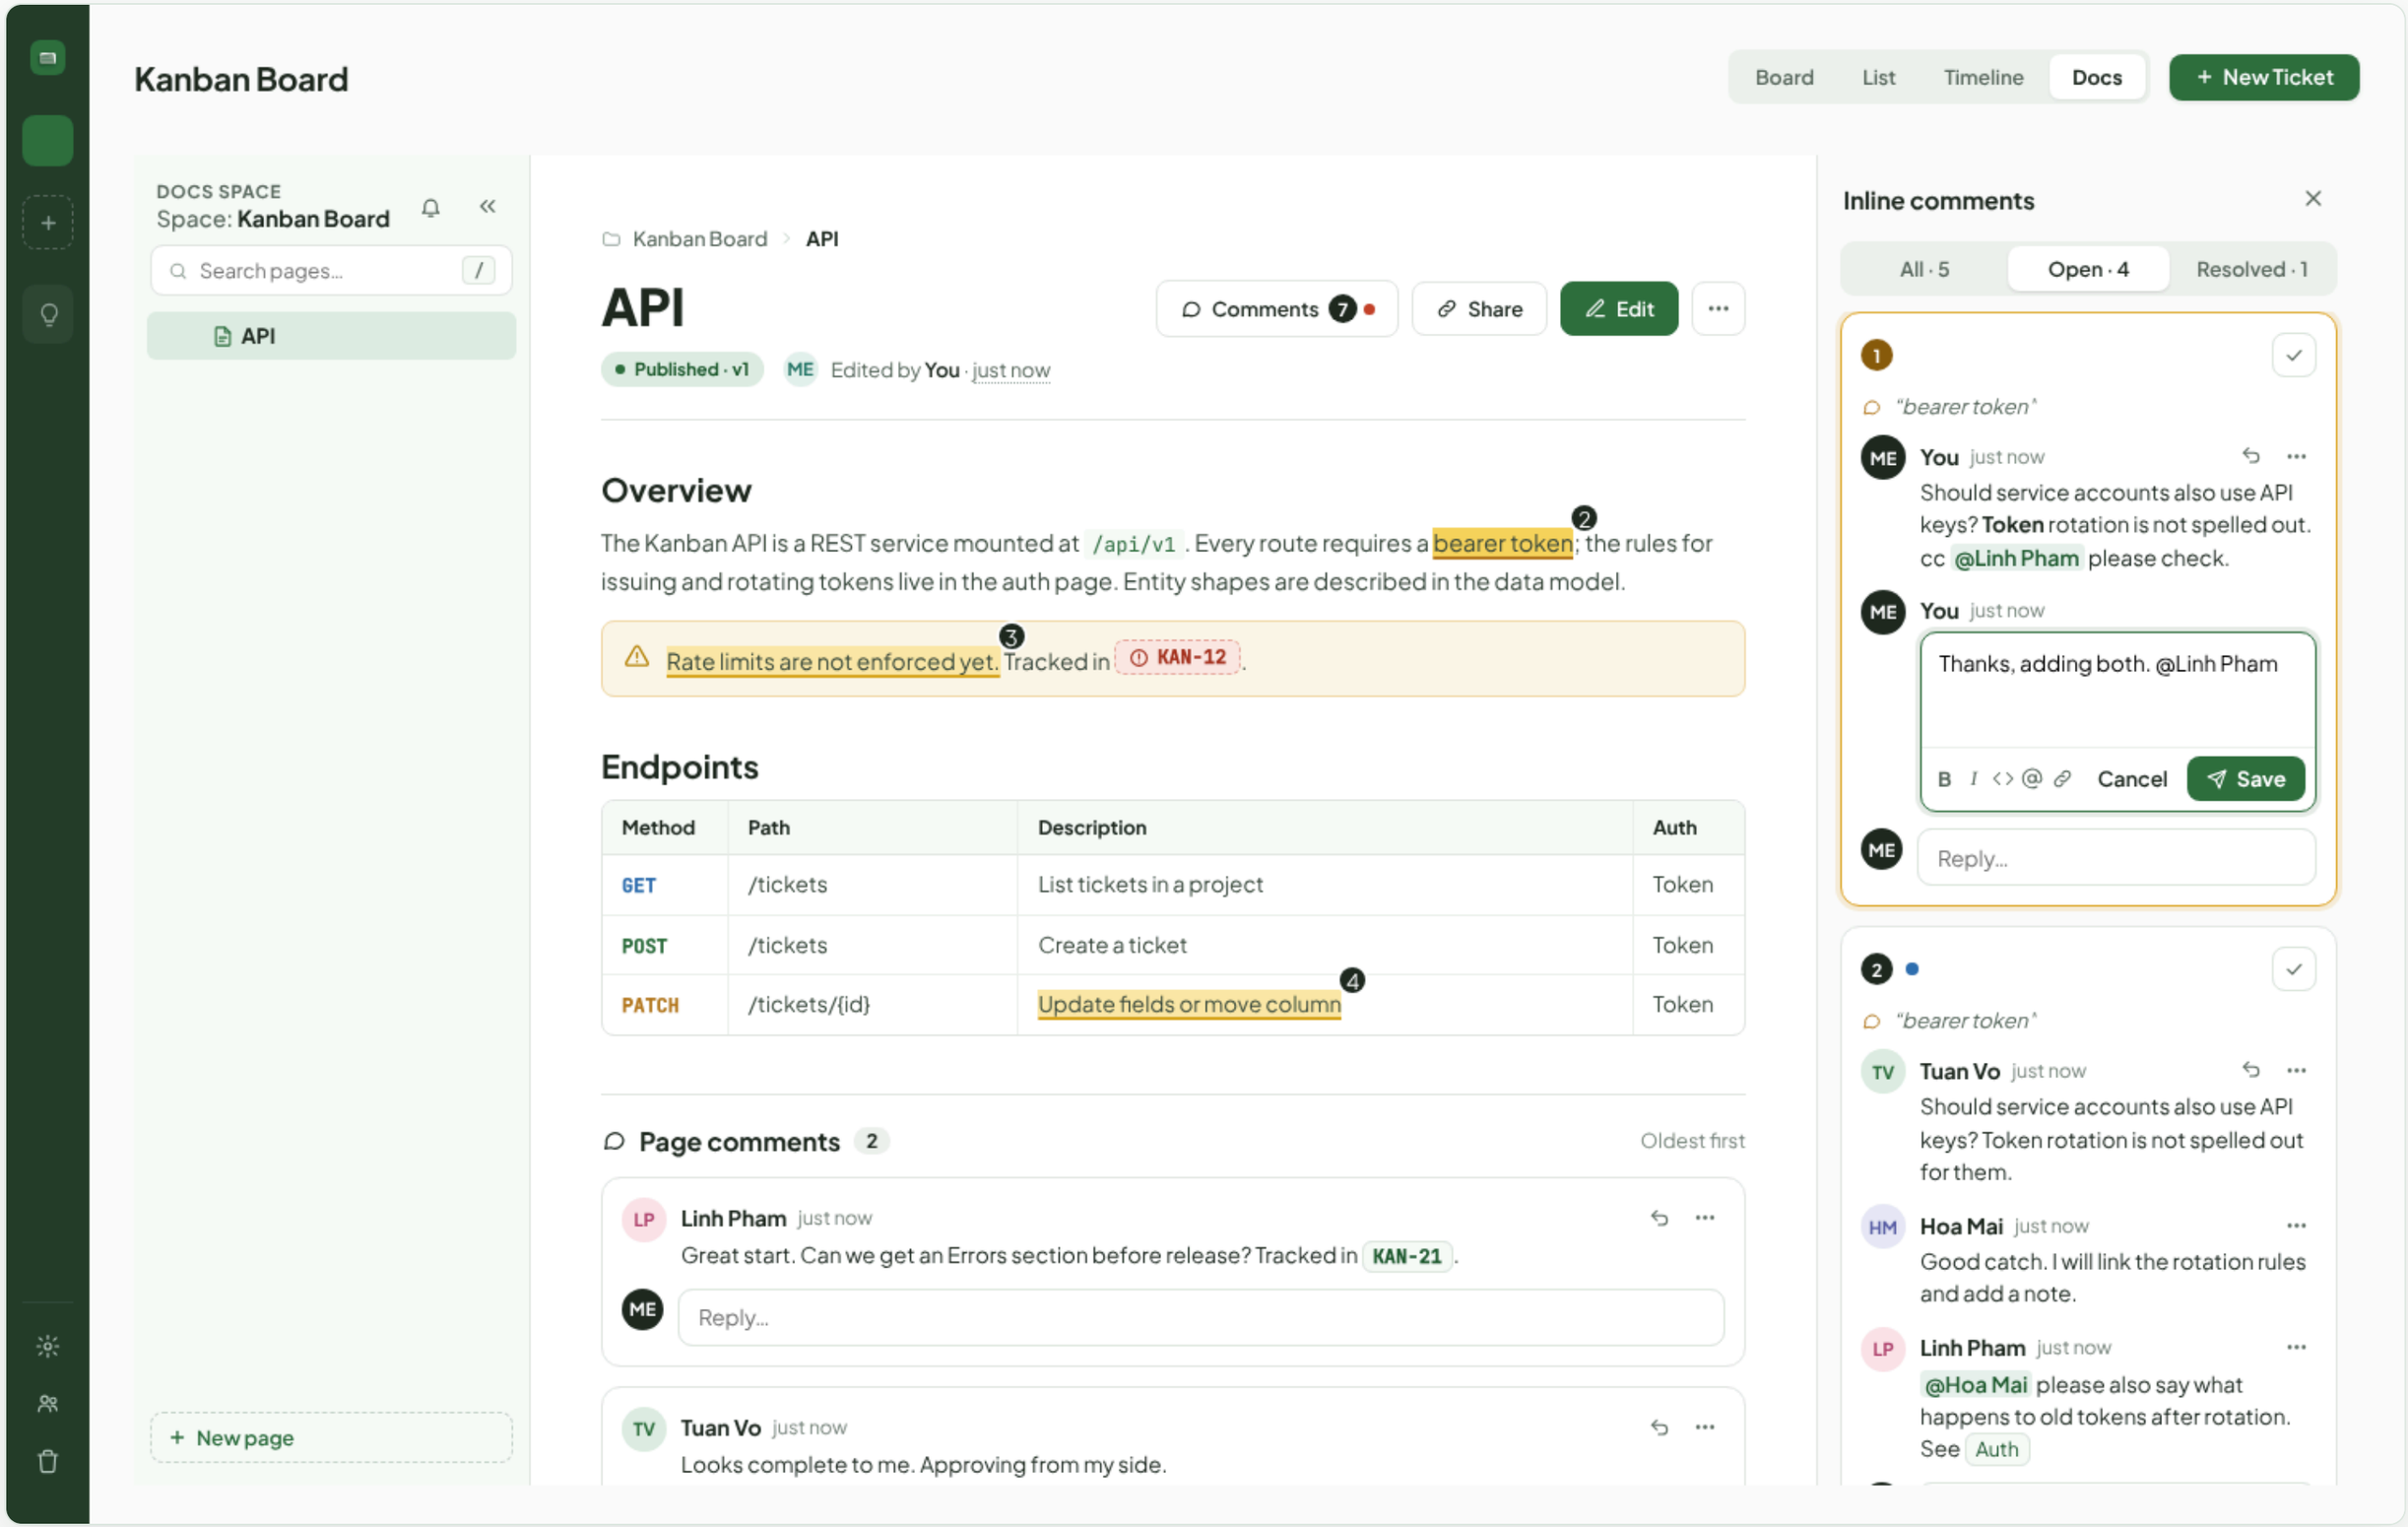

6. Thread actions

Edit (author only), Copy link and Delete (author or admin) in the actions menu.

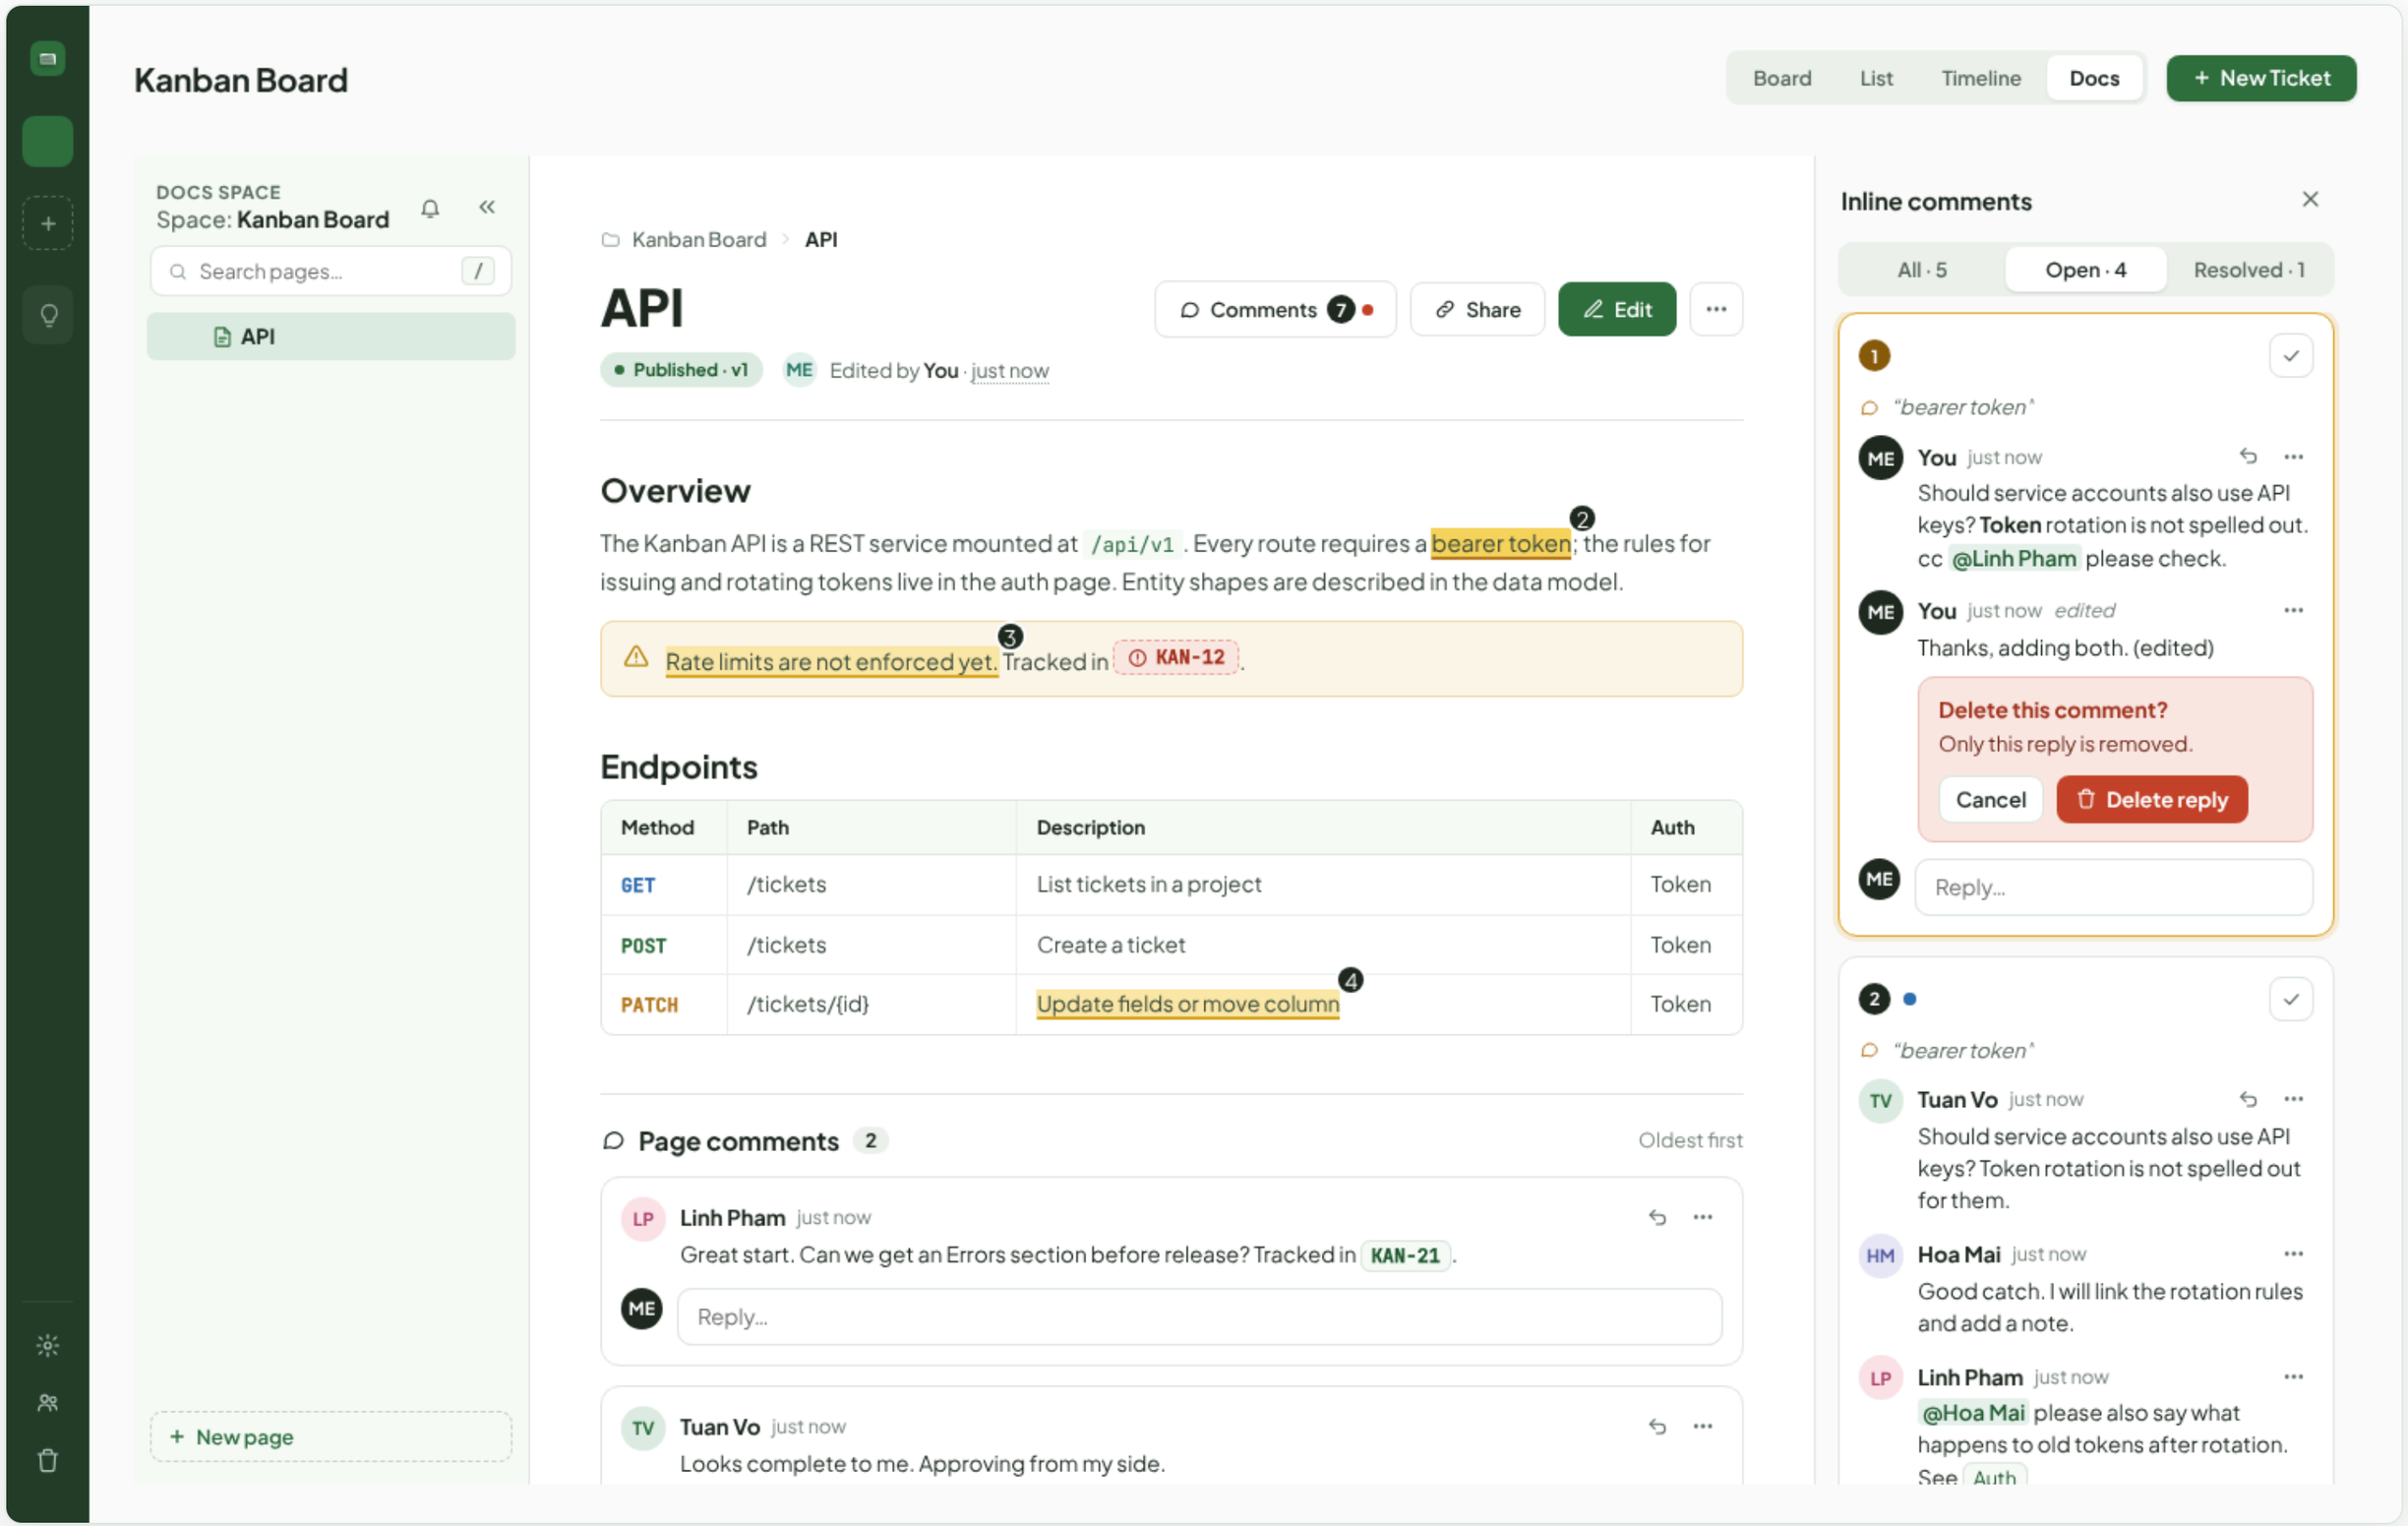

7. Editing your own comment

Edited comments are labelled "edited".

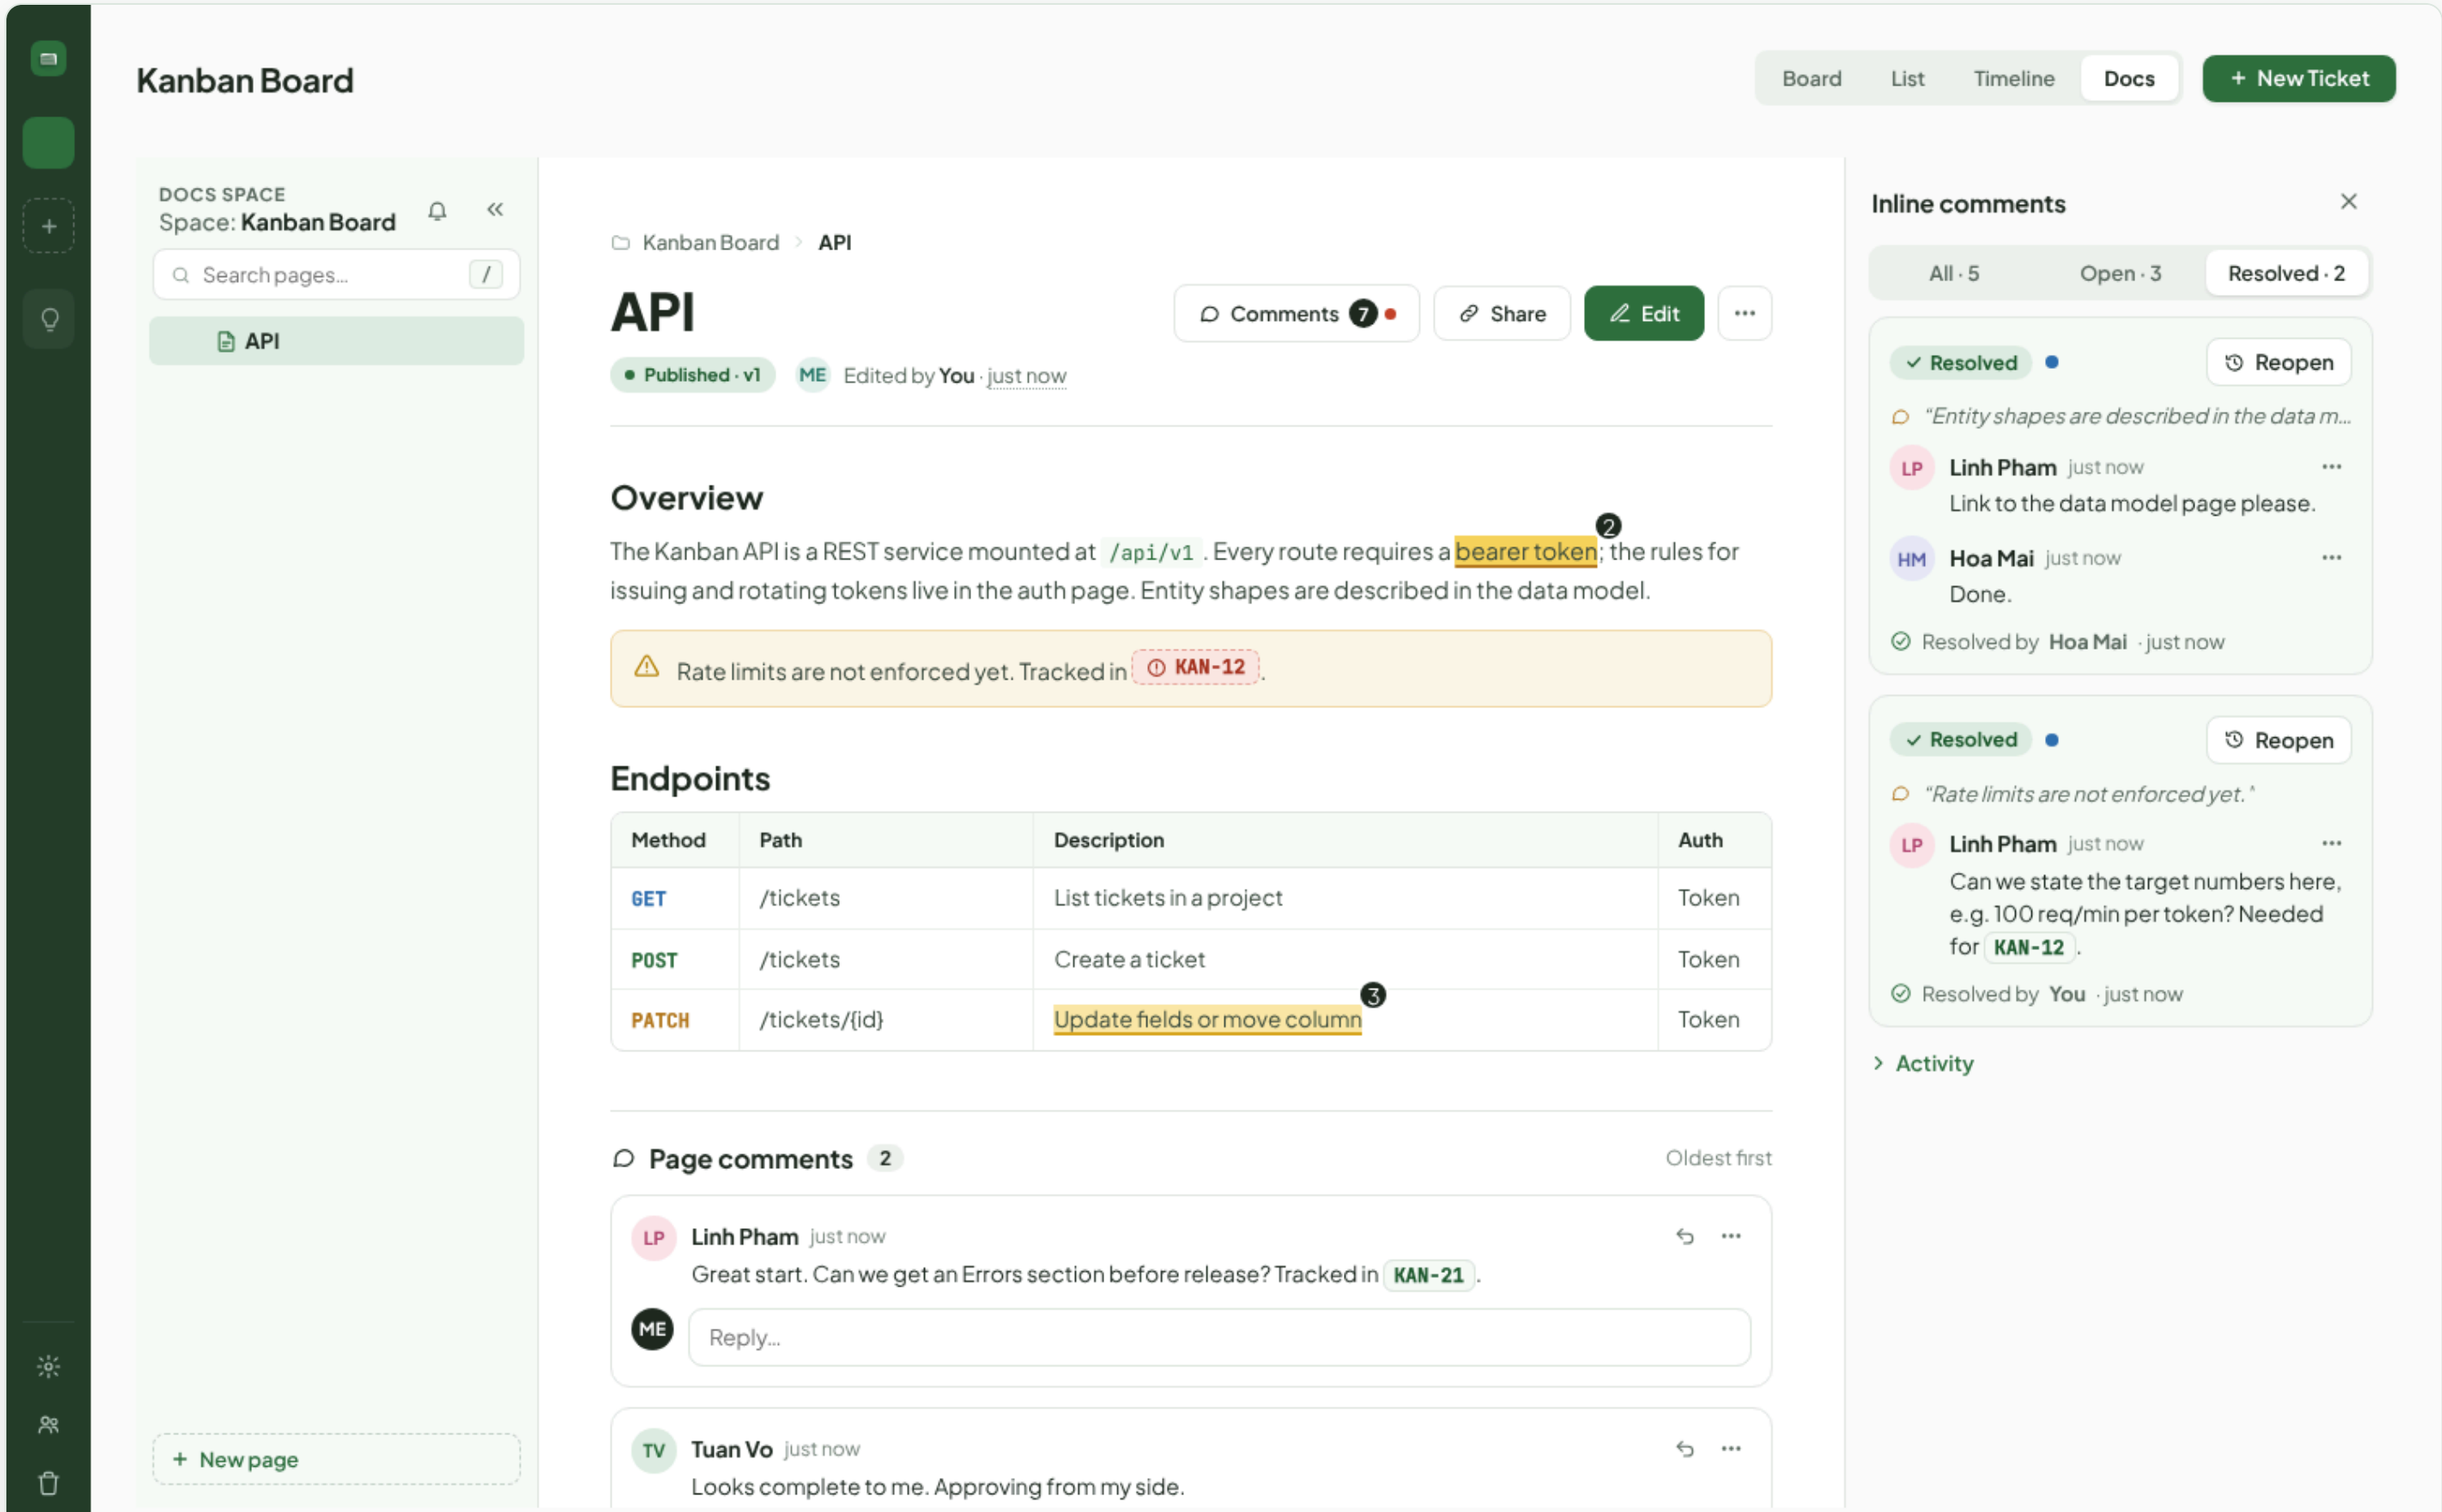

8. Delete confirmation

Deleting a reply removes only that reply; deleting the first comment removes the whole thread and its highlight.

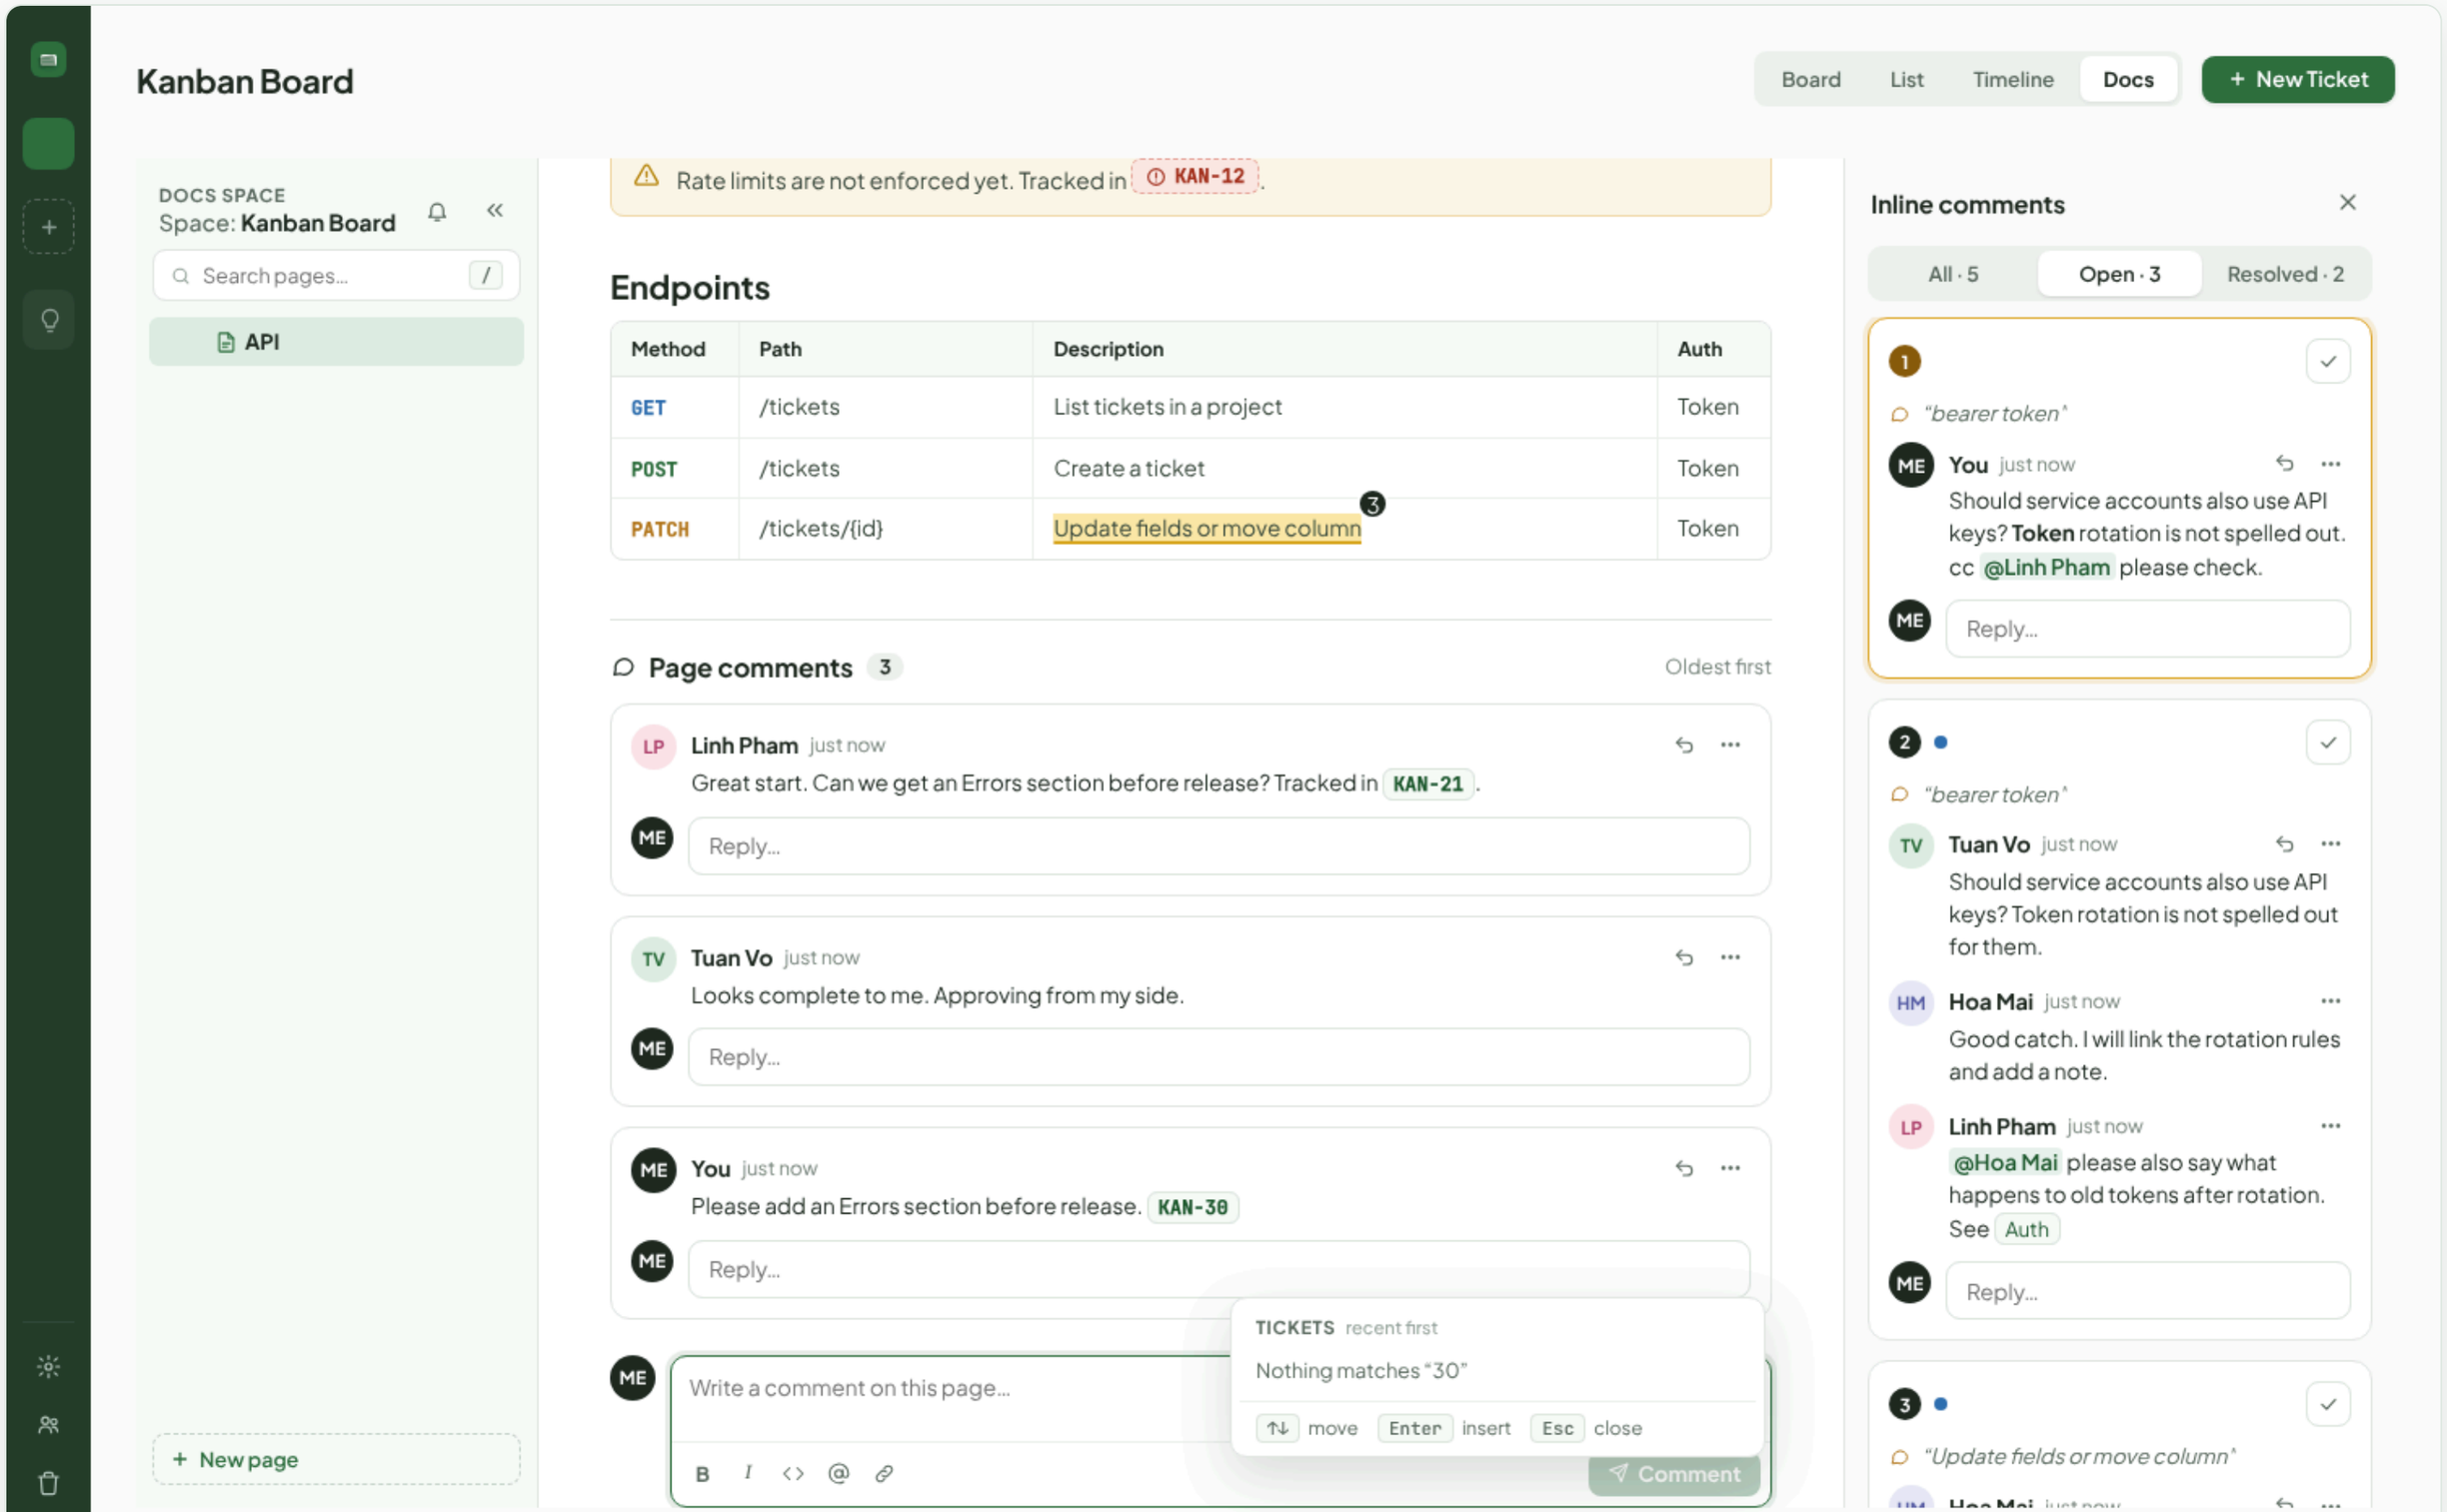

9. Resolve and Reopen

Resolved threads leave the page and live in the Resolved tab with who resolved them; Reopen brings the highlight back.

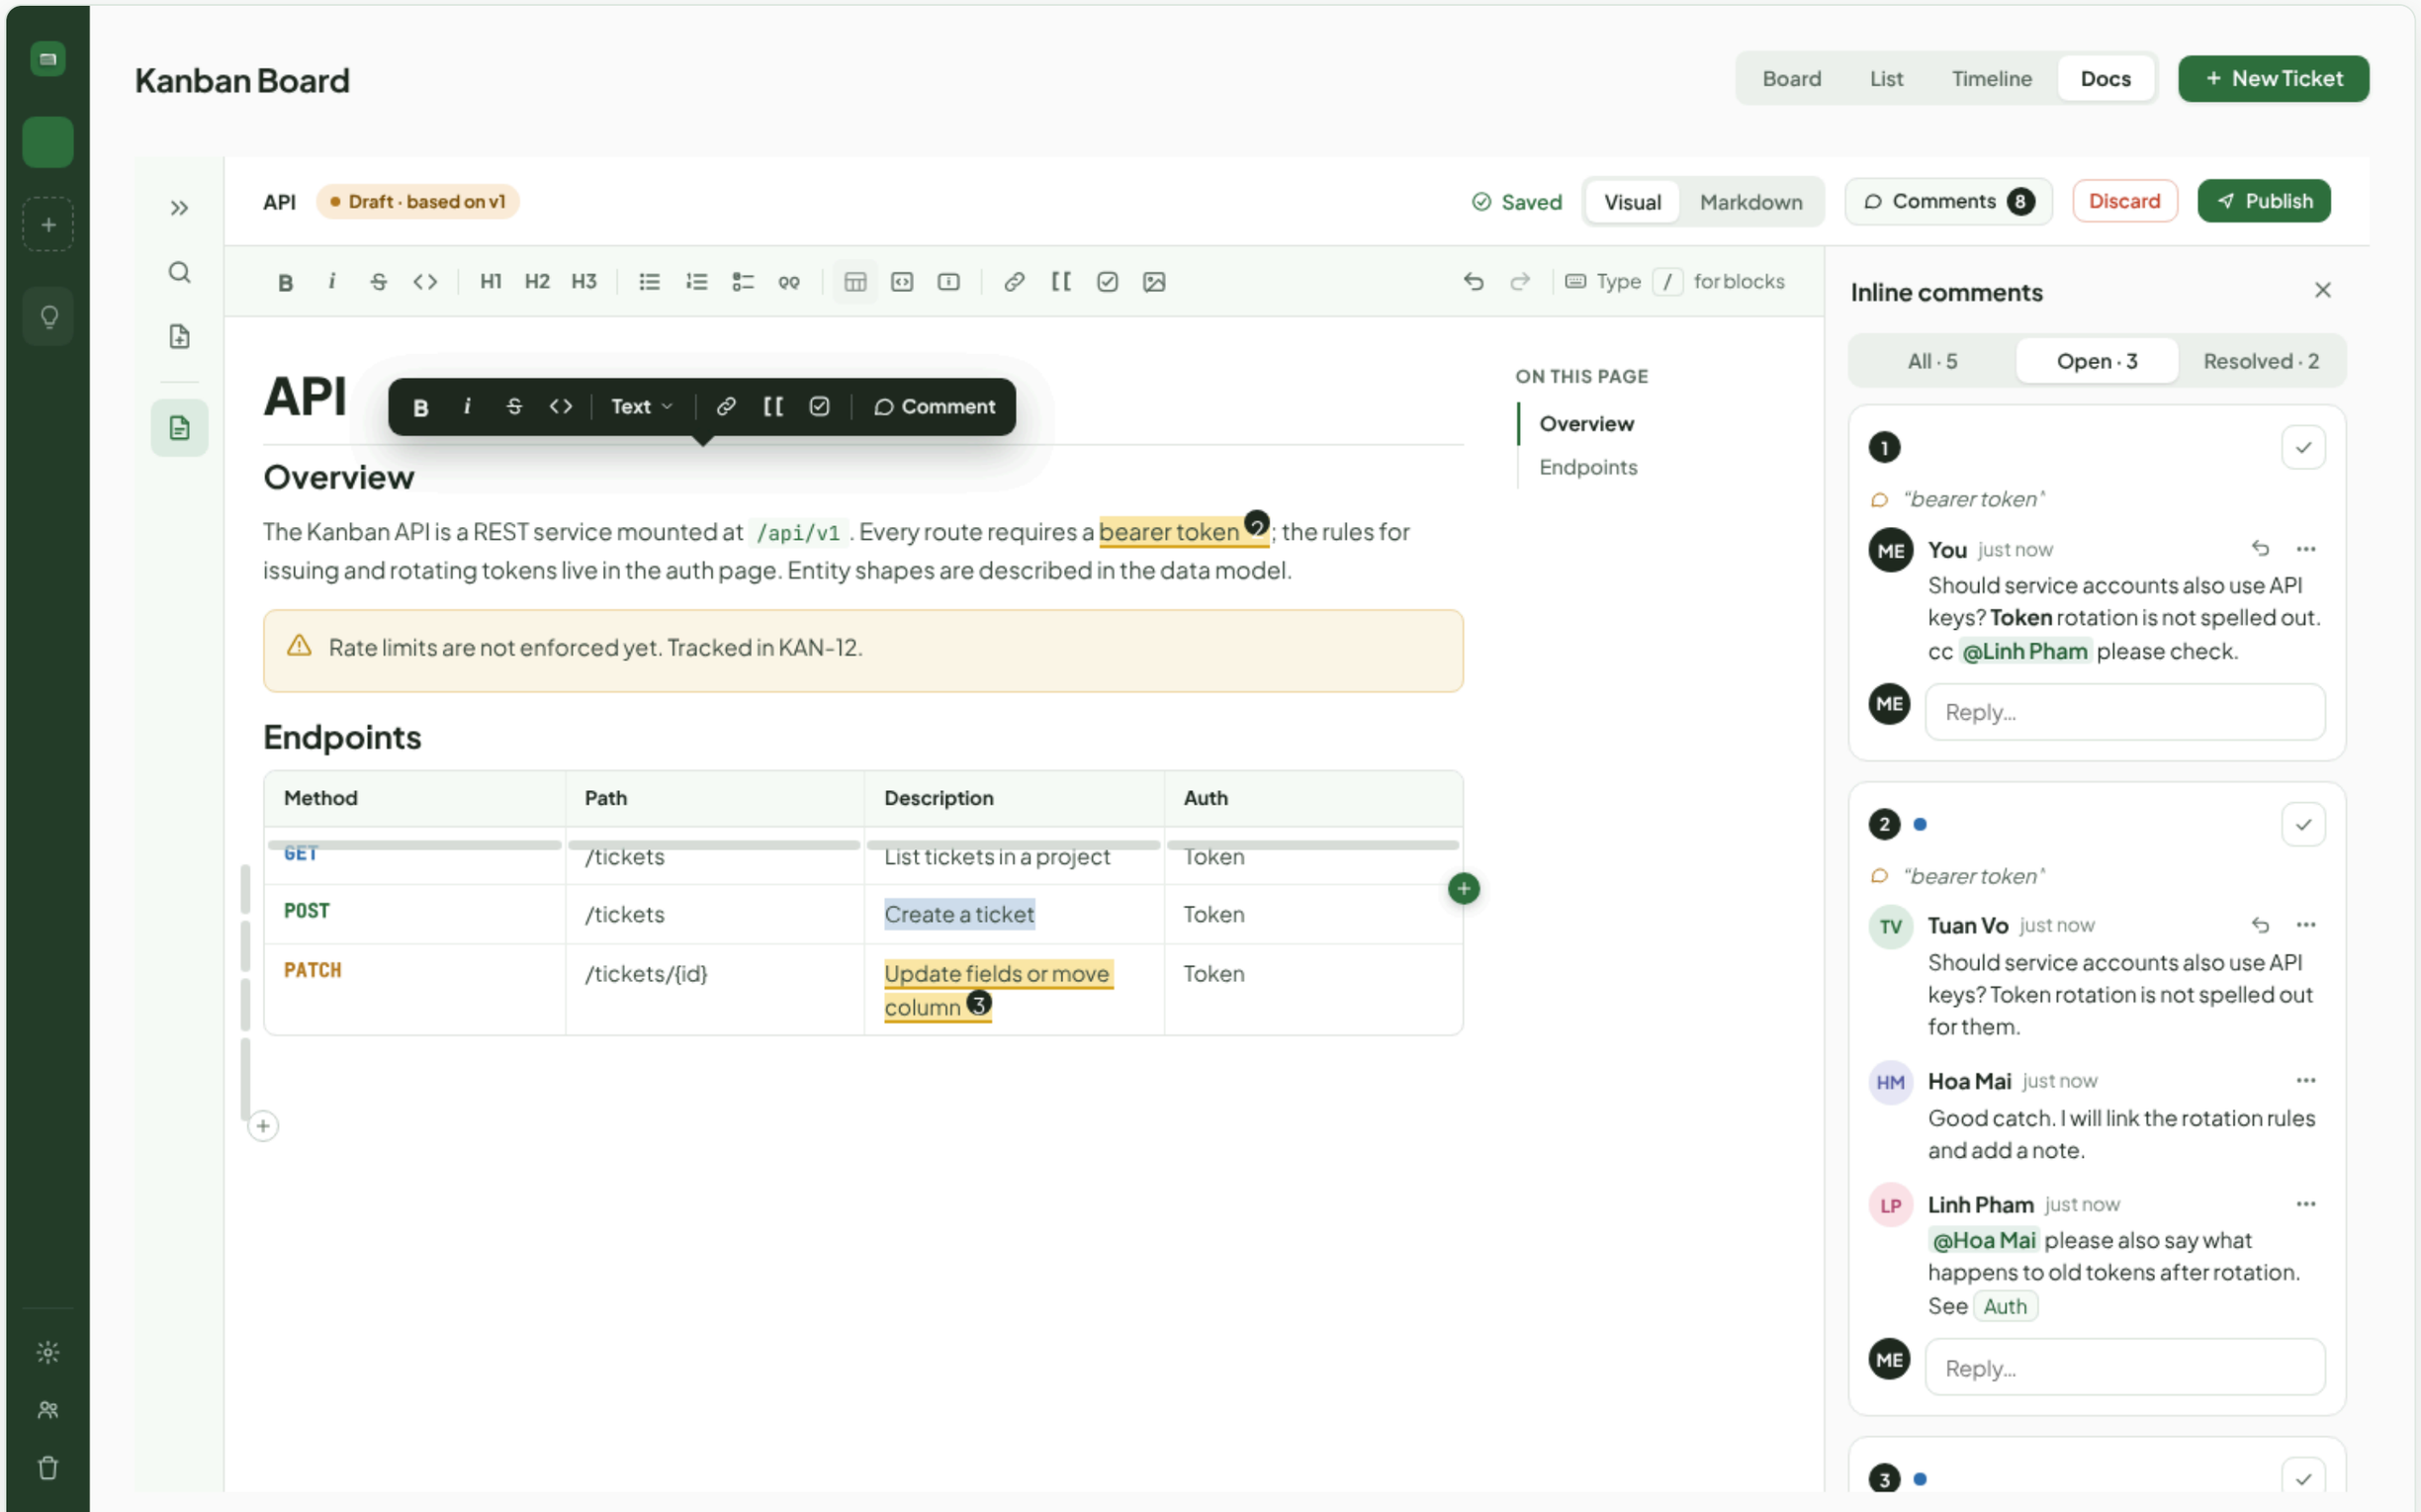

10. Page comments

Comments not tied to any text sit at the bottom of the page (oldest first), with replies and a composer.

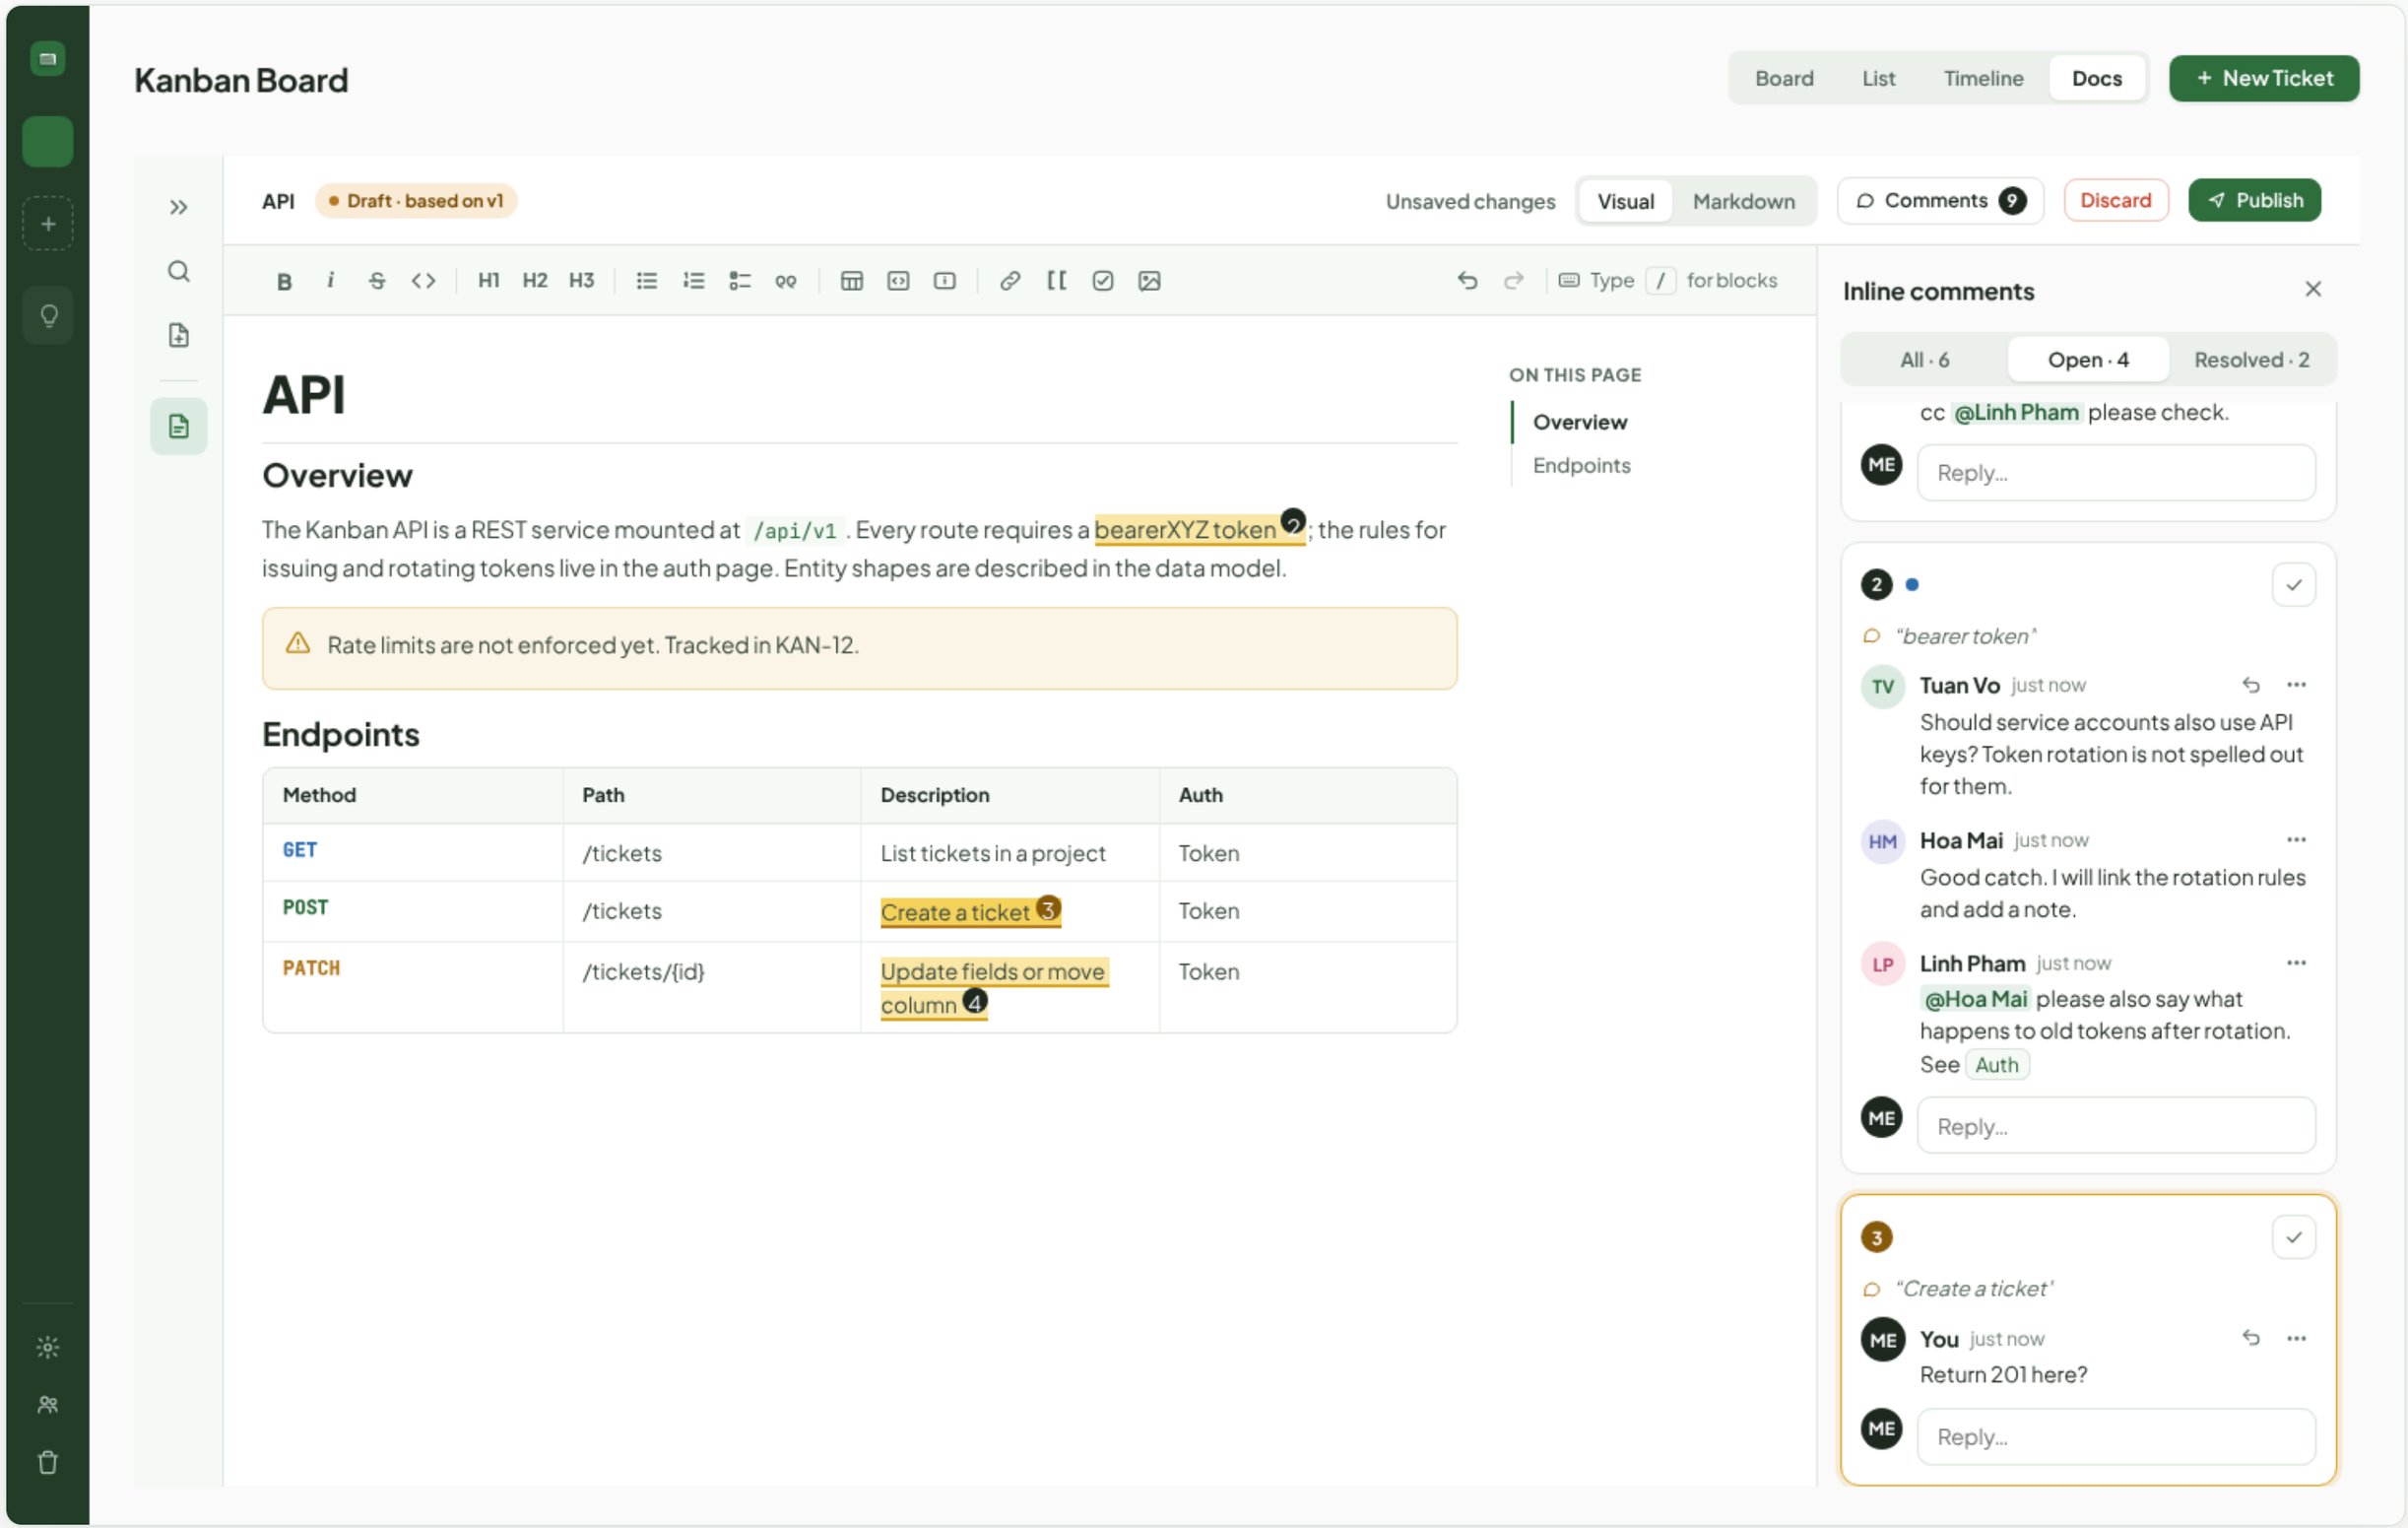

11. Comment from the editor

In edit mode the highlights are shown too, and the selection toolbar has a Comment action.

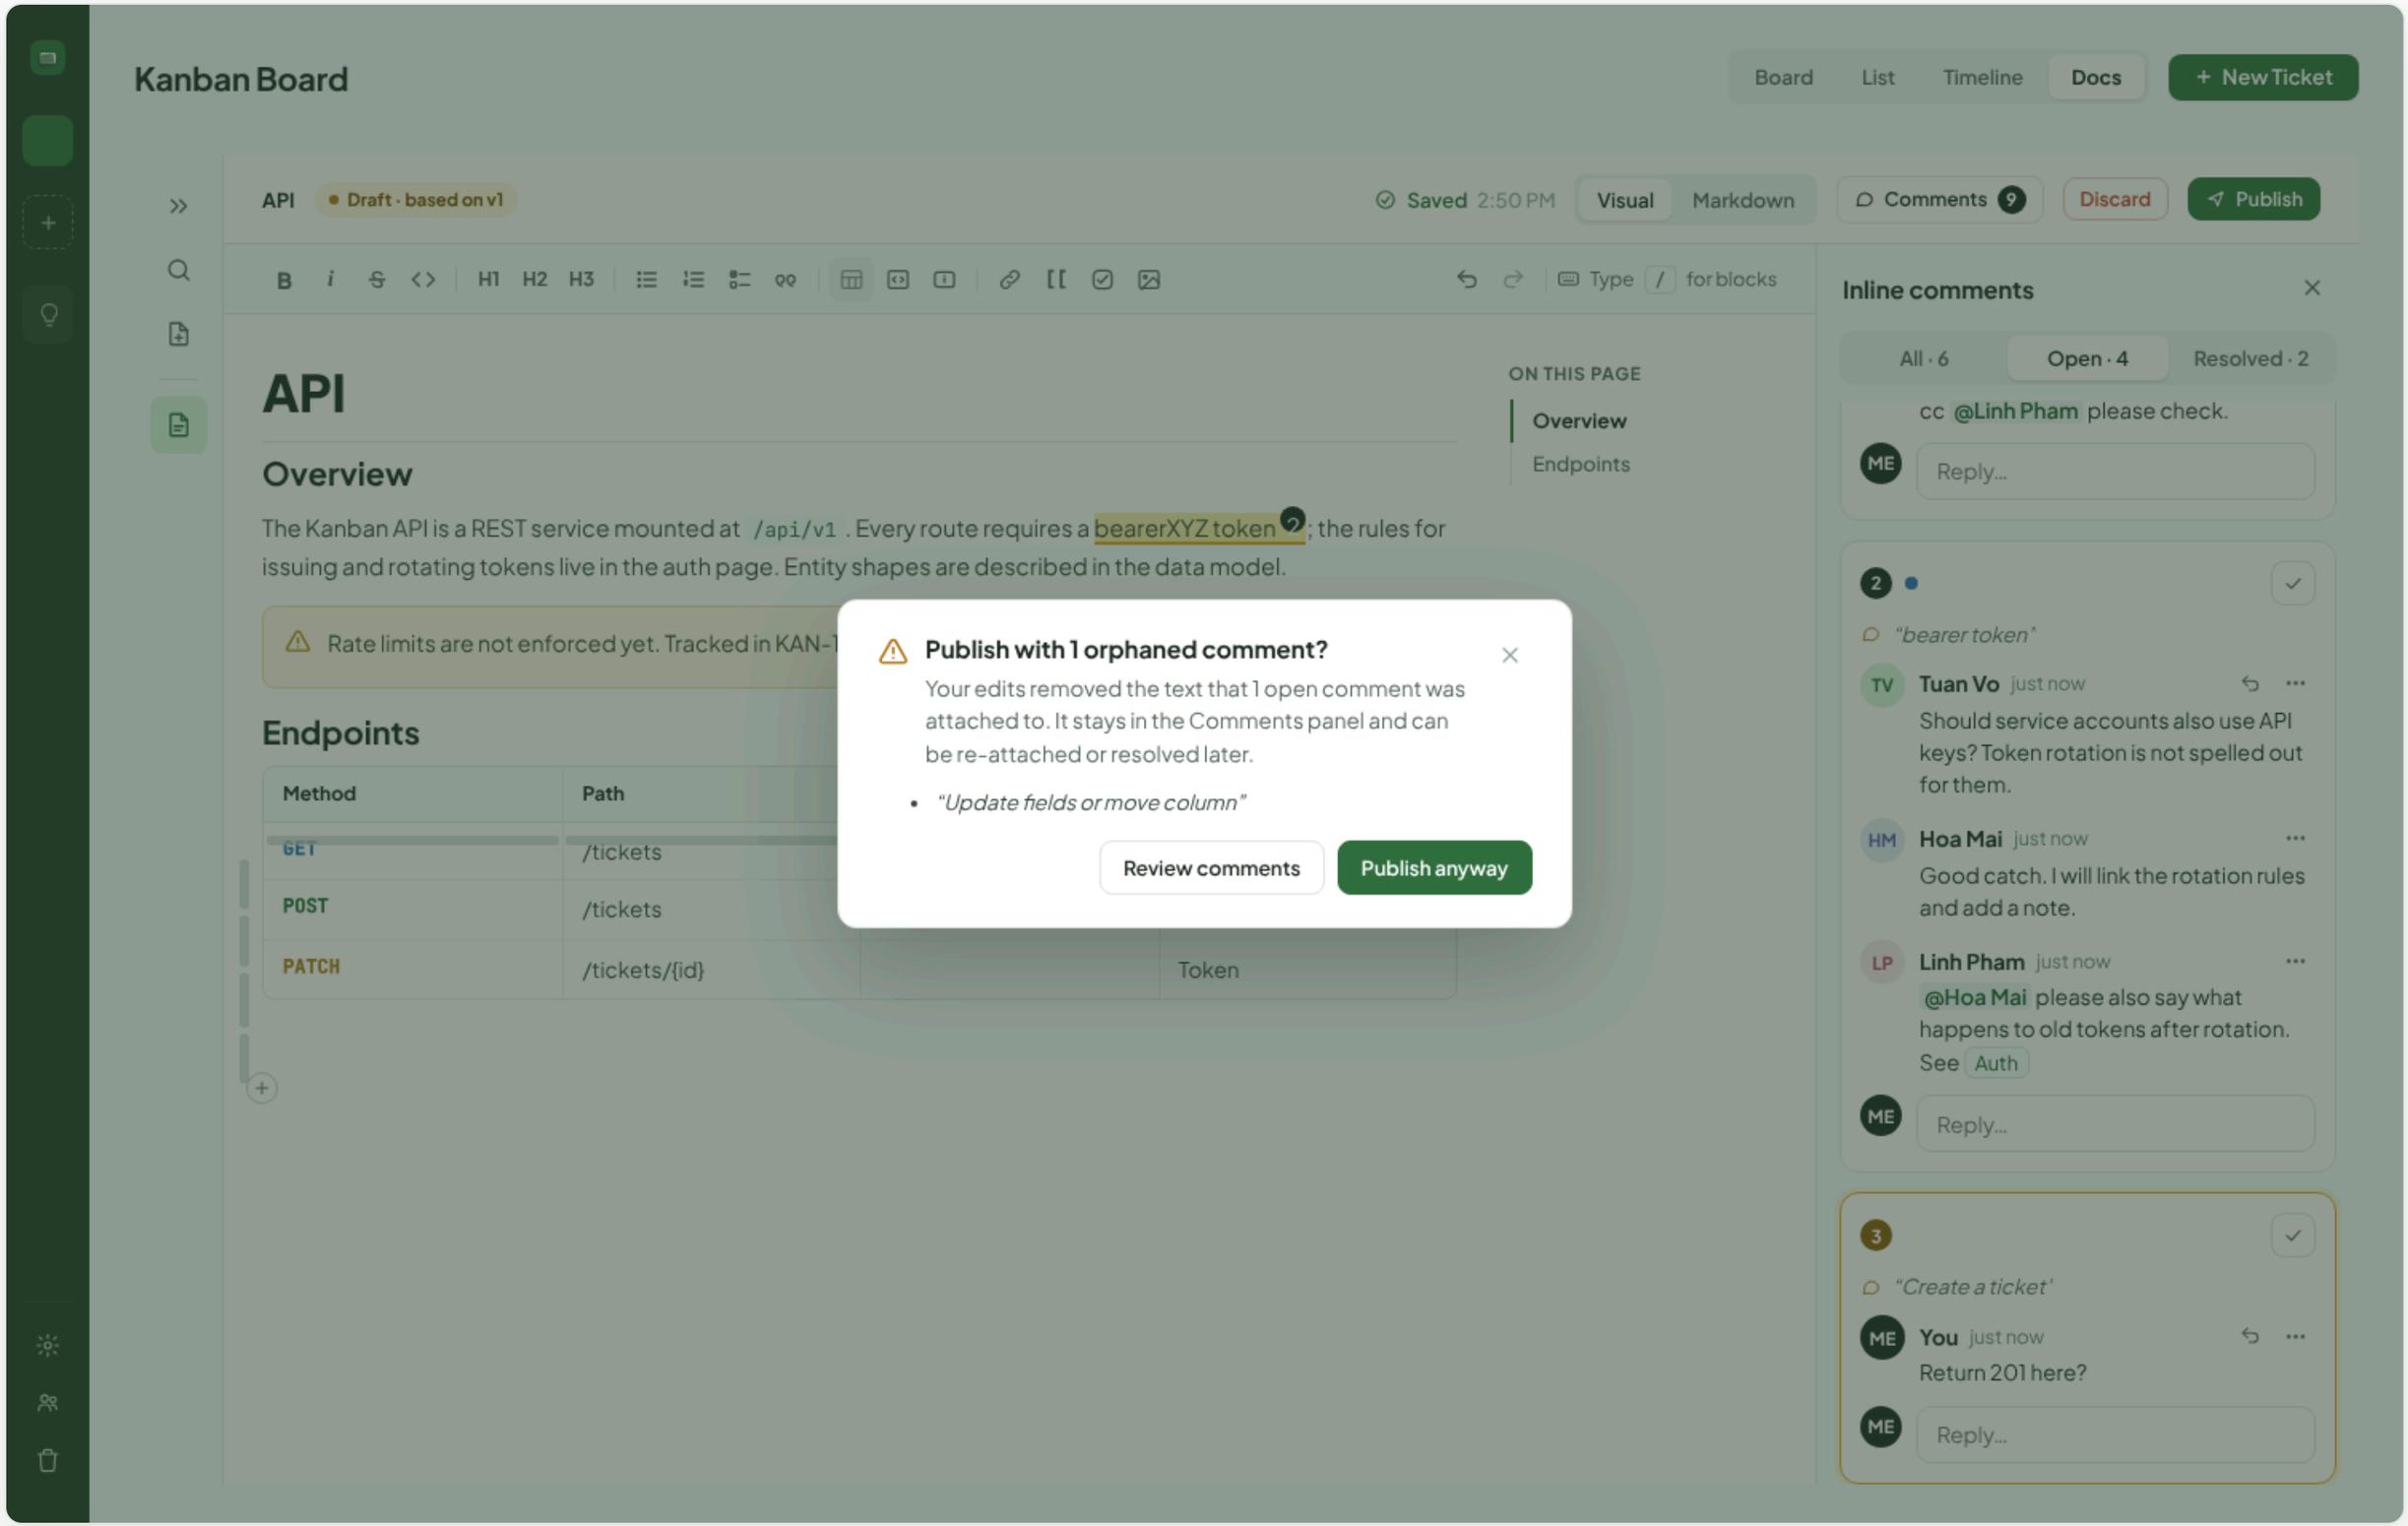

12. Typing inside a highlight keeps the comment attached

The highlight grows with the text ("bearerXYZ token"); the thread stays attached.

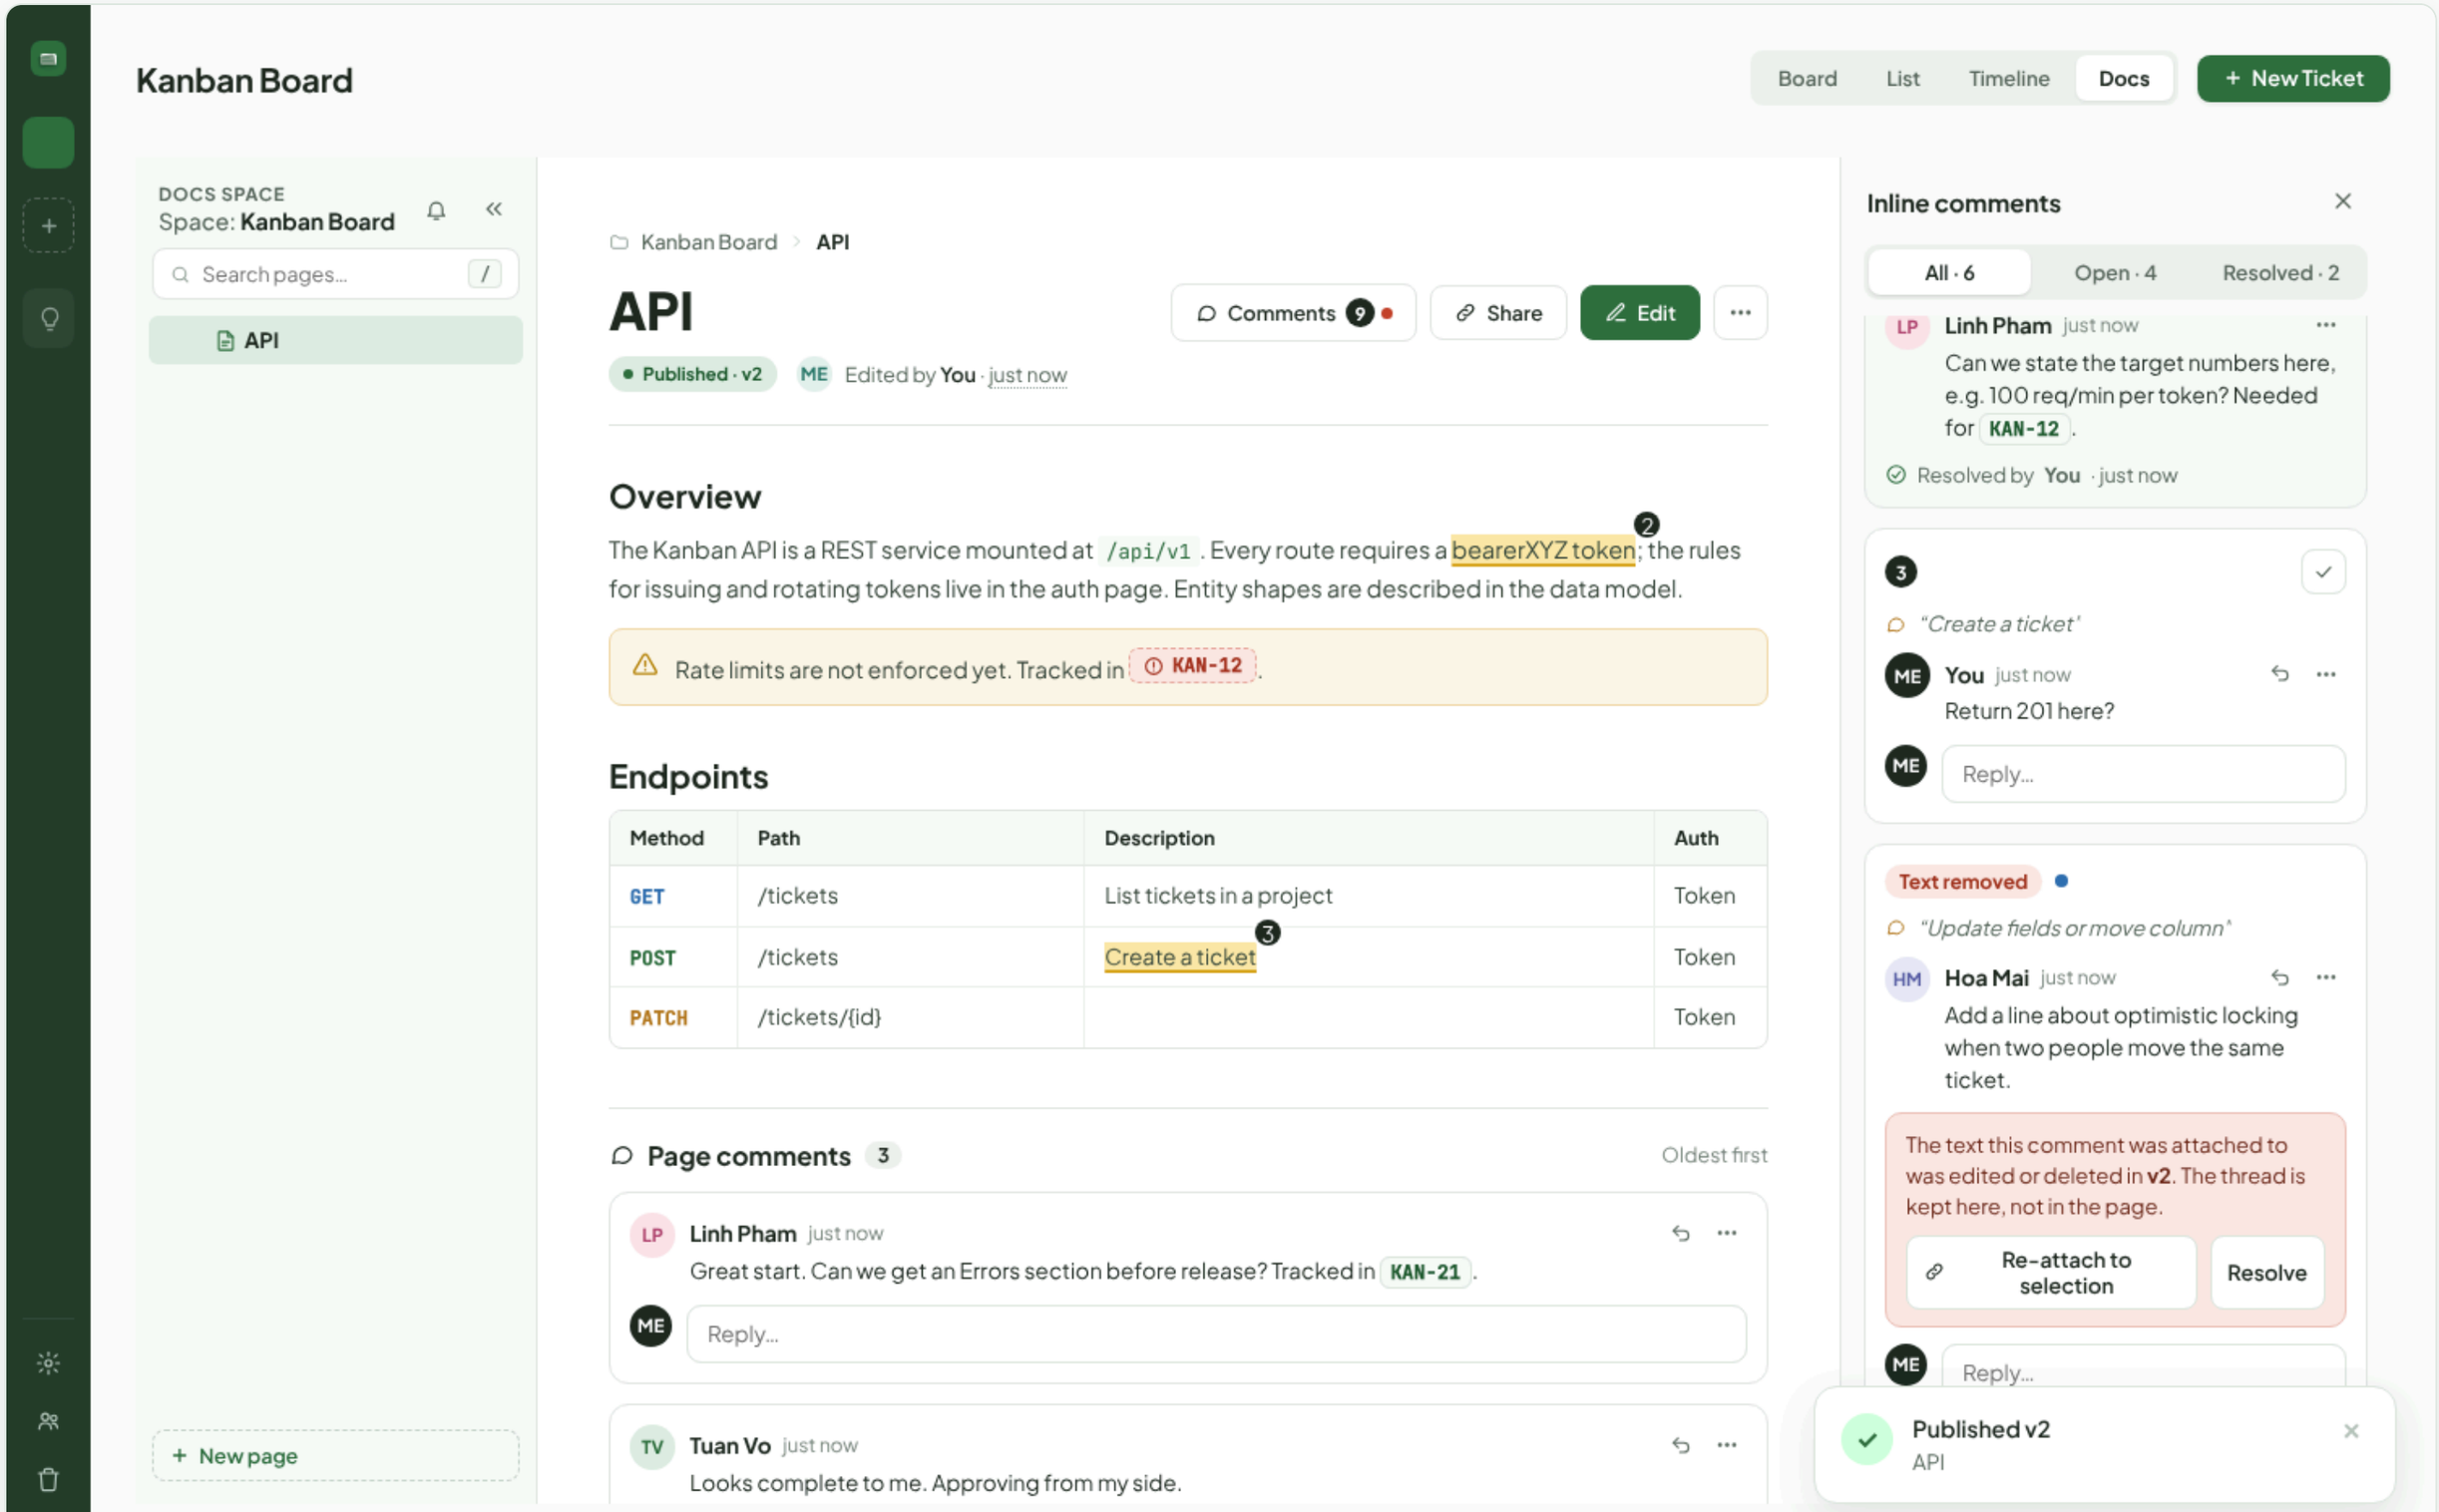

13. Publish warning

Removing the whole highlighted text would orphan its thread: publishing asks first and offers to review the comments.

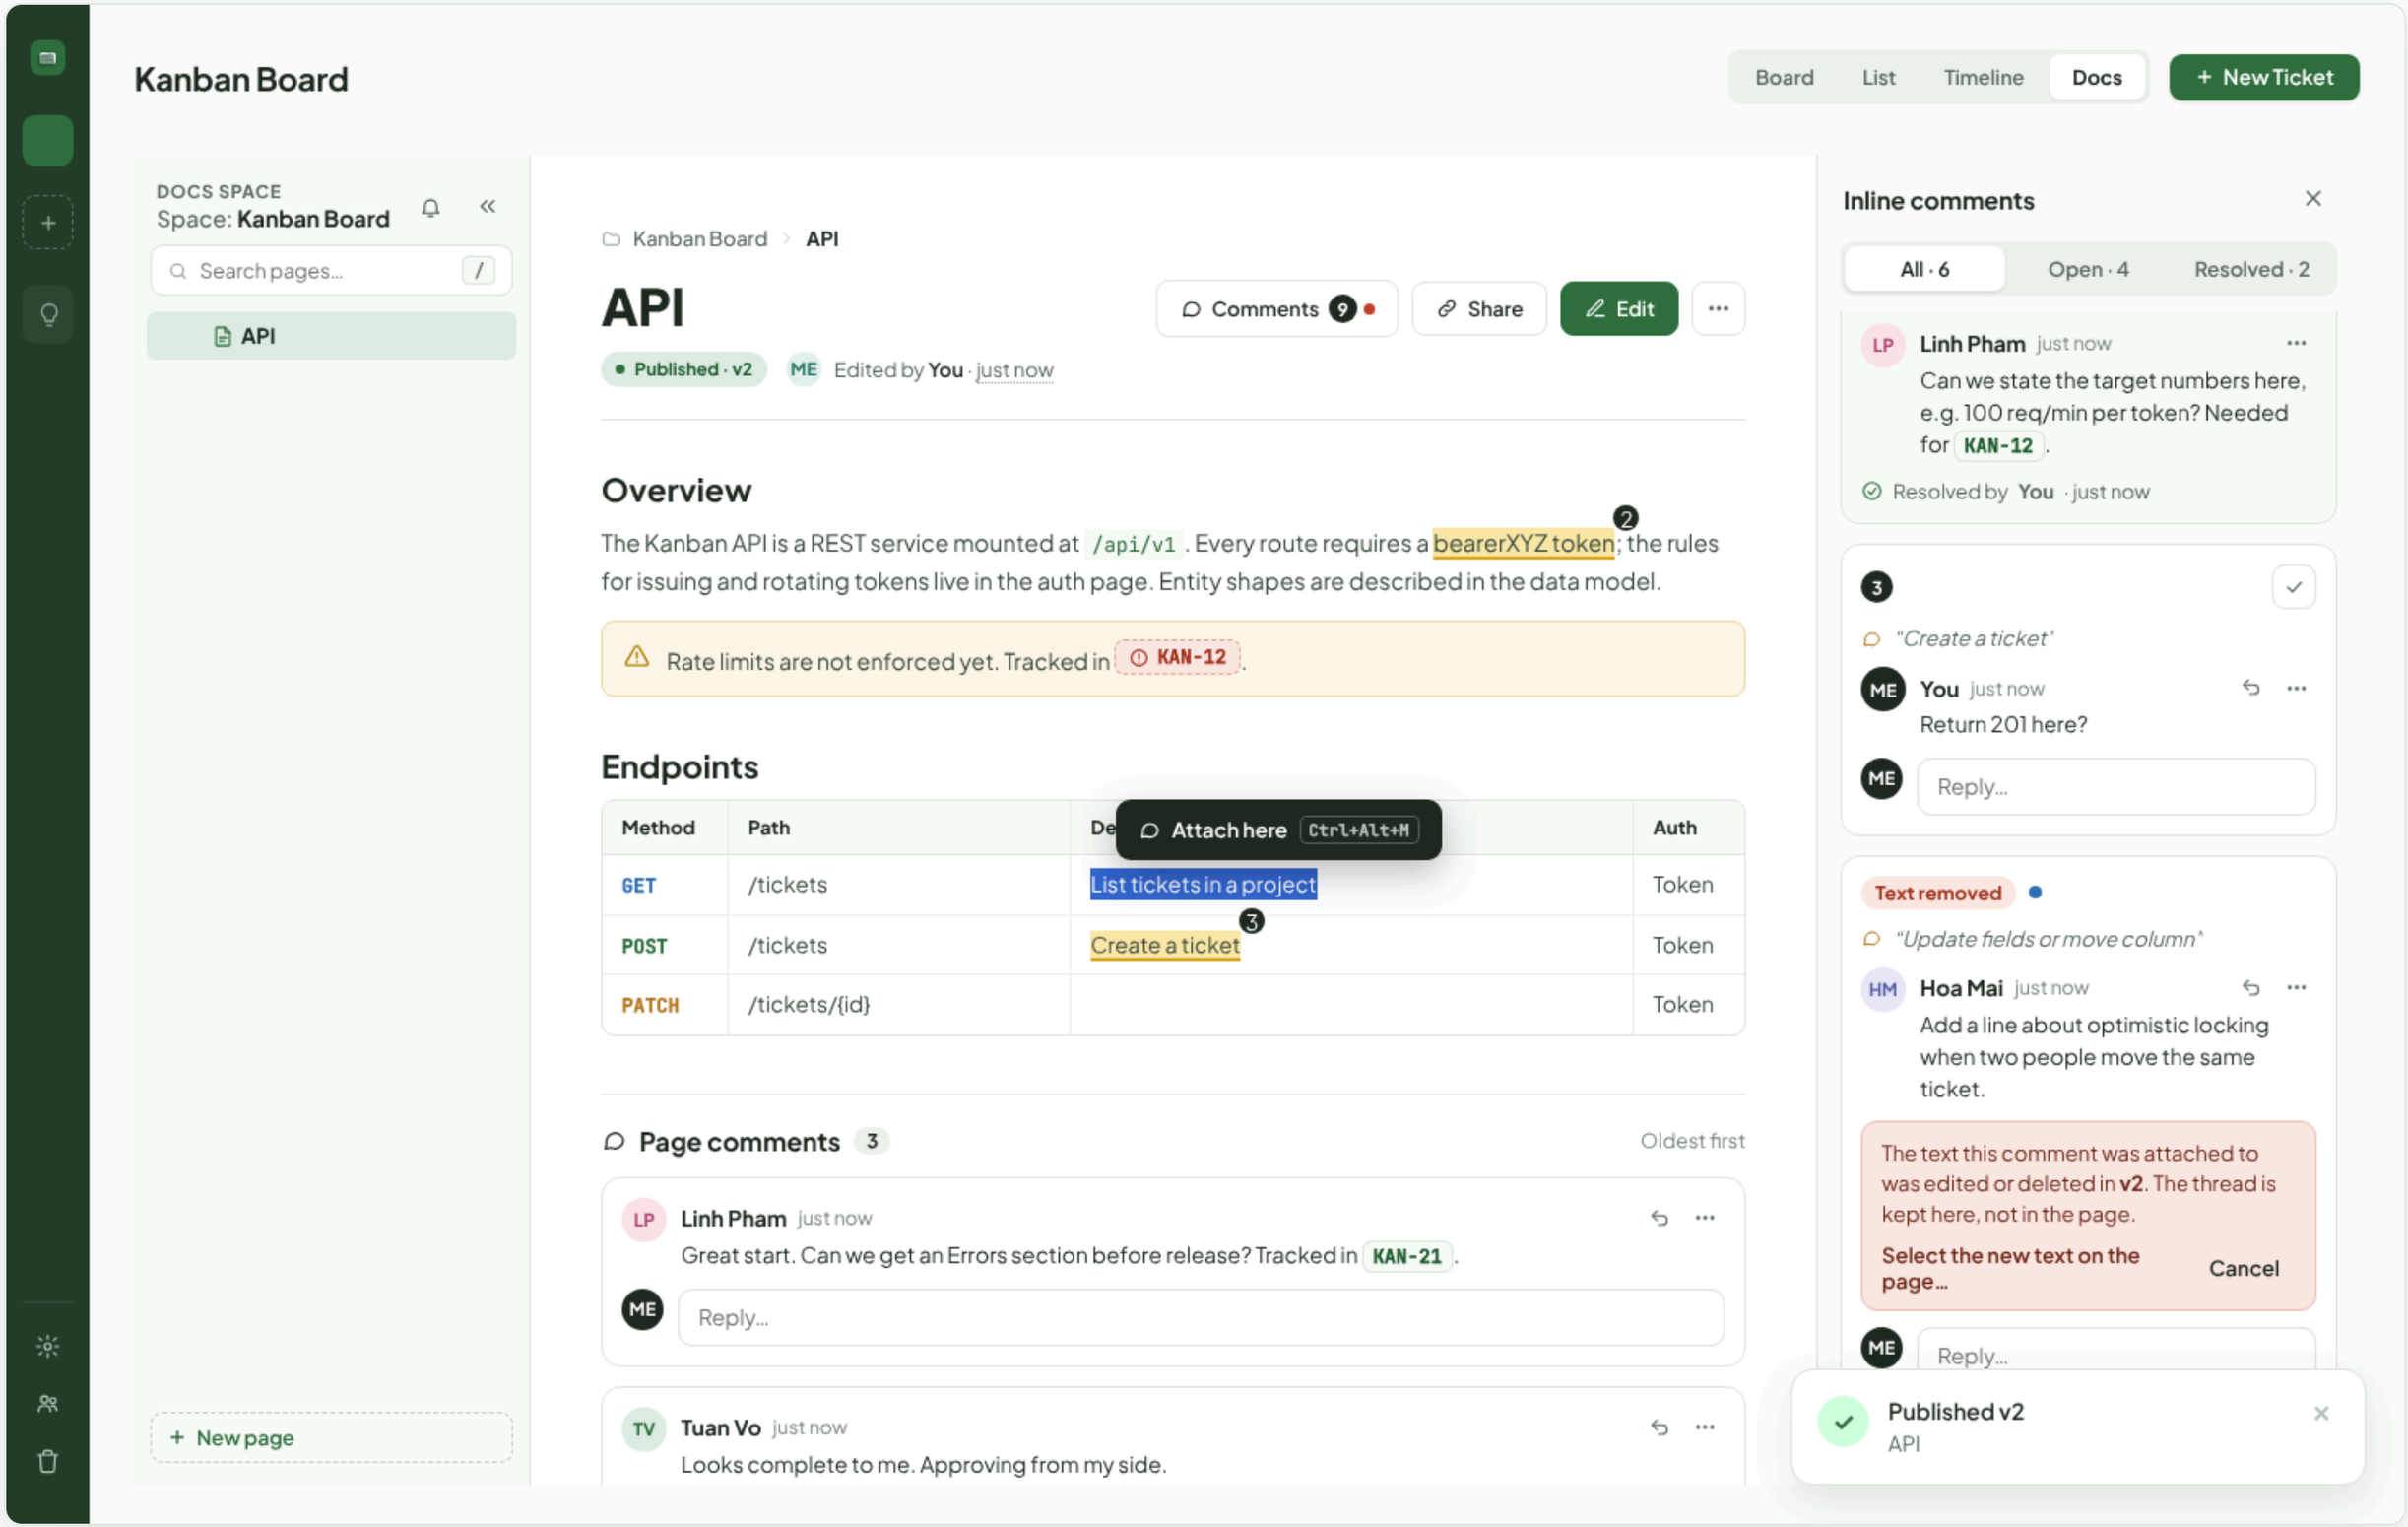

14. Orphaned thread

After publishing, the thread whose text was removed is kept with a "Text removed" warning; the others followed their (edited) text. It can be re-attached or resolved.

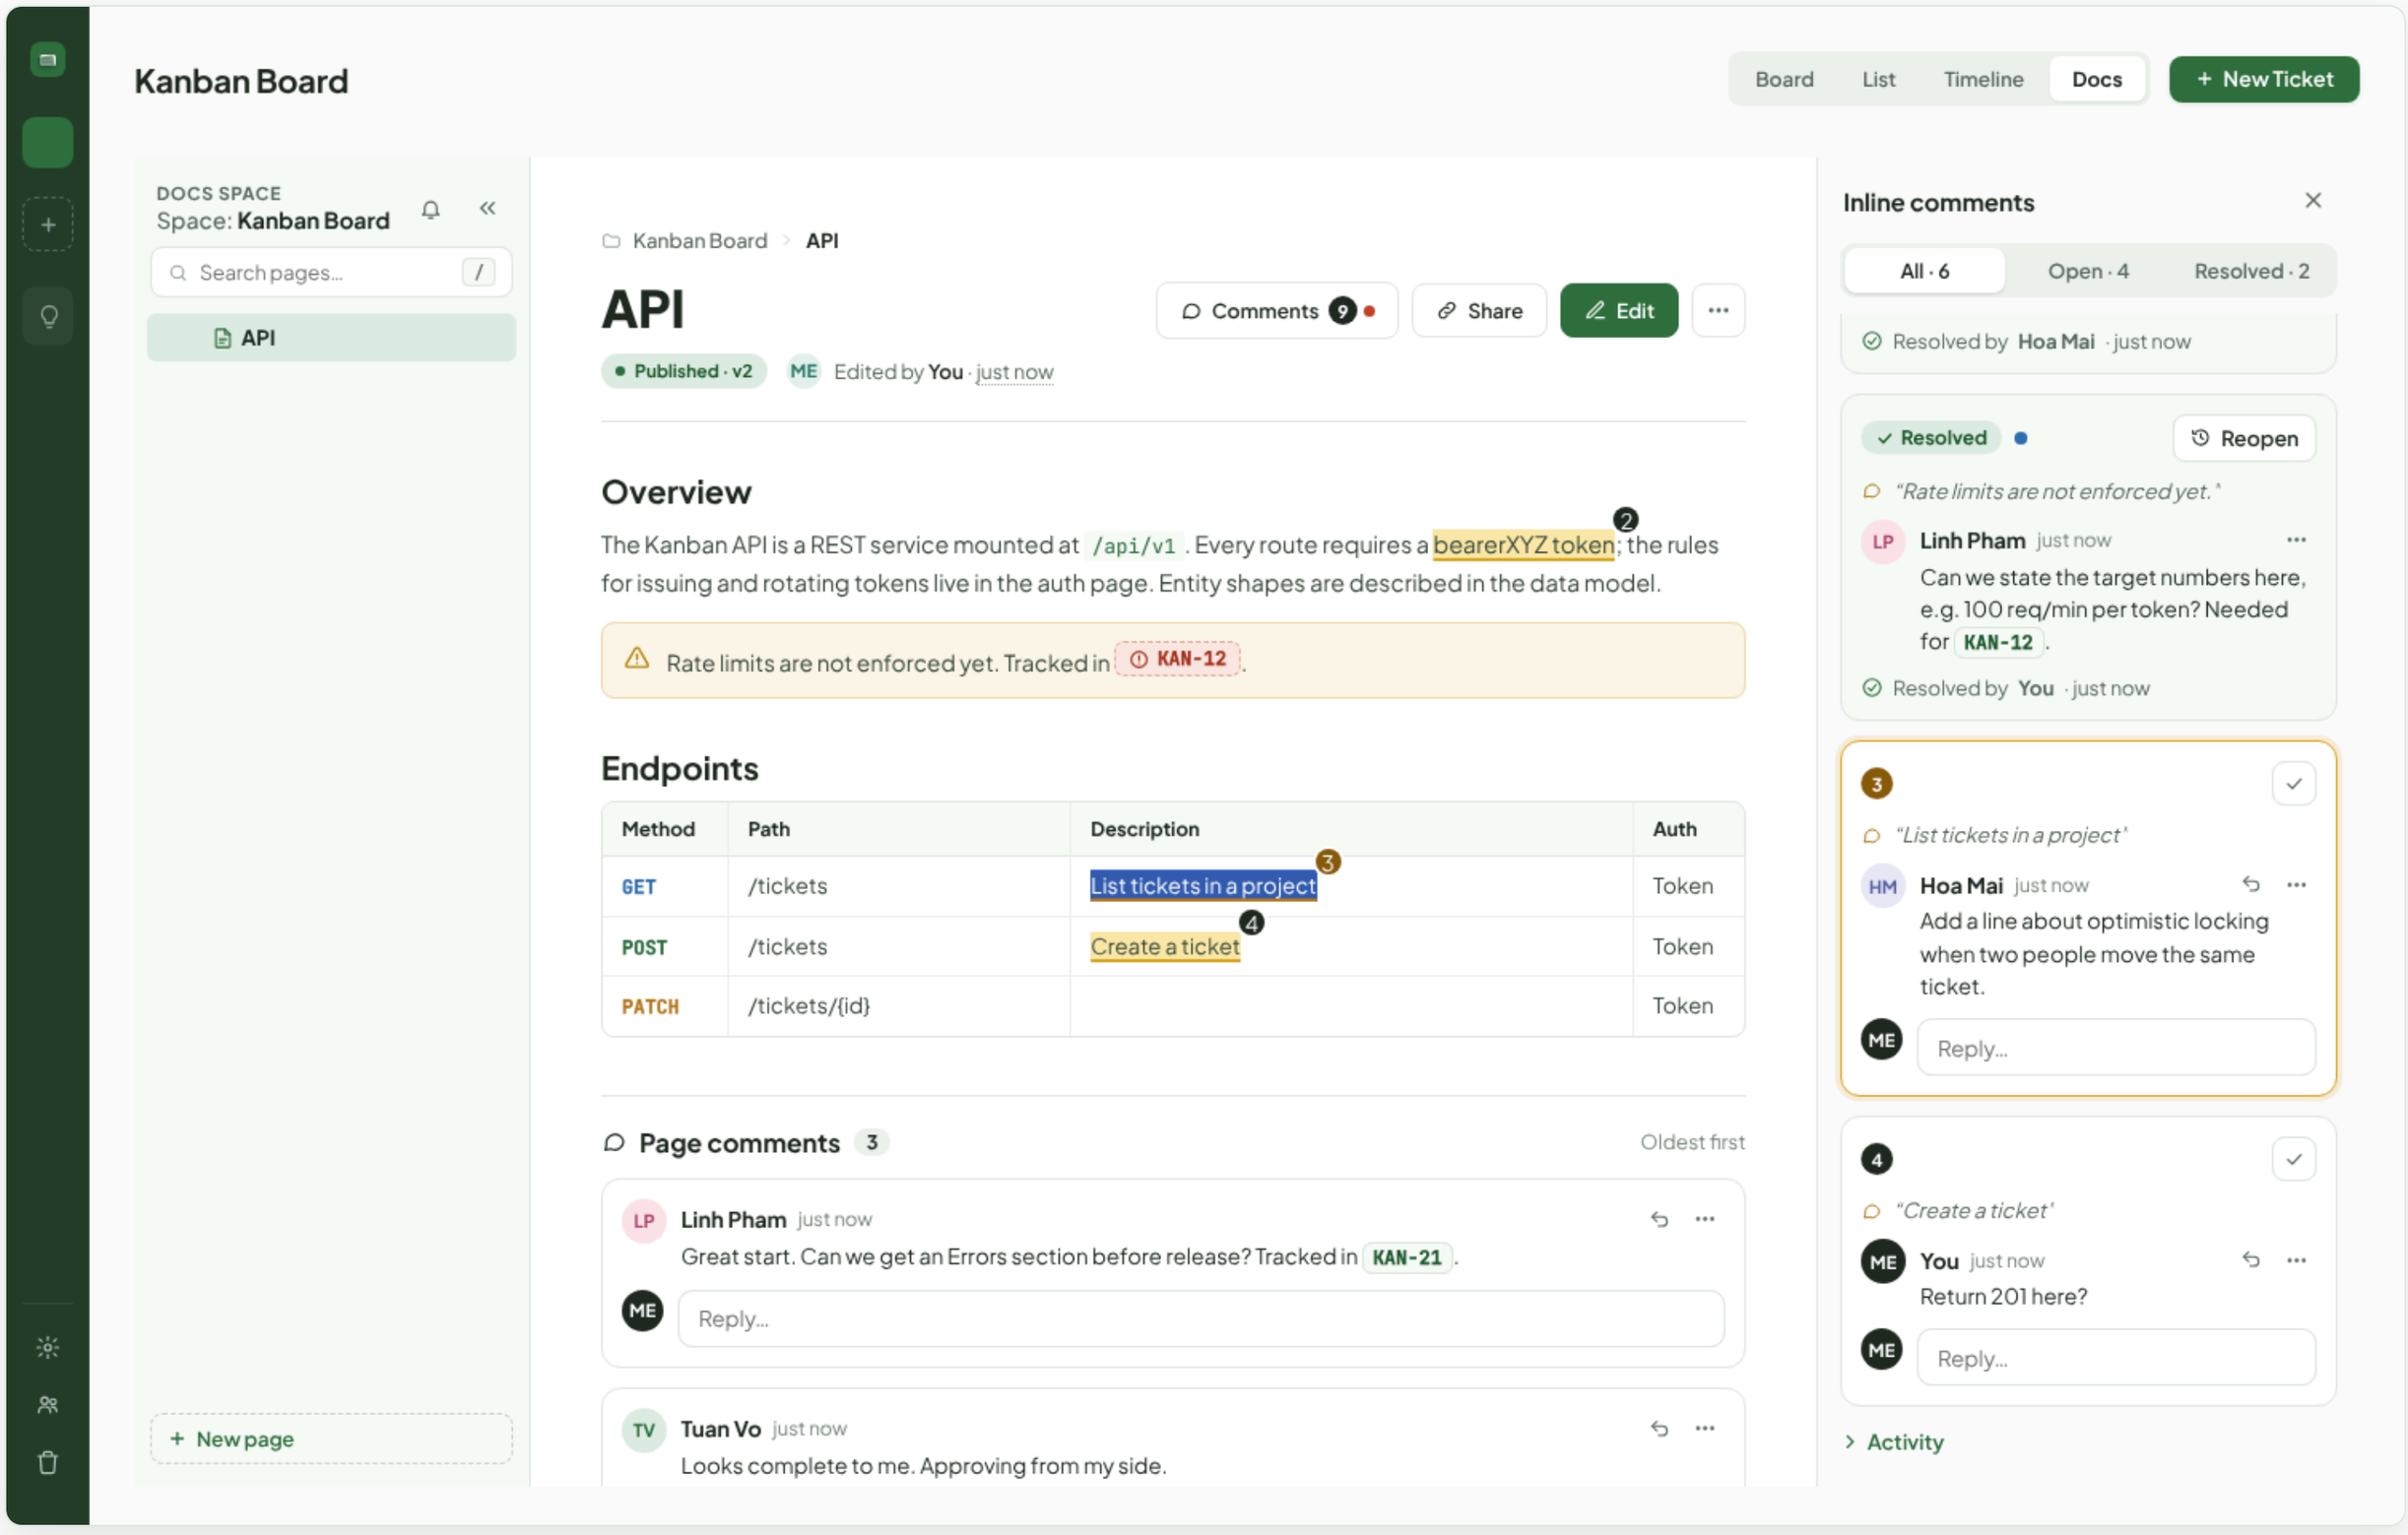

15. Re-attach to a new selection

Select new text and choose Attach here.

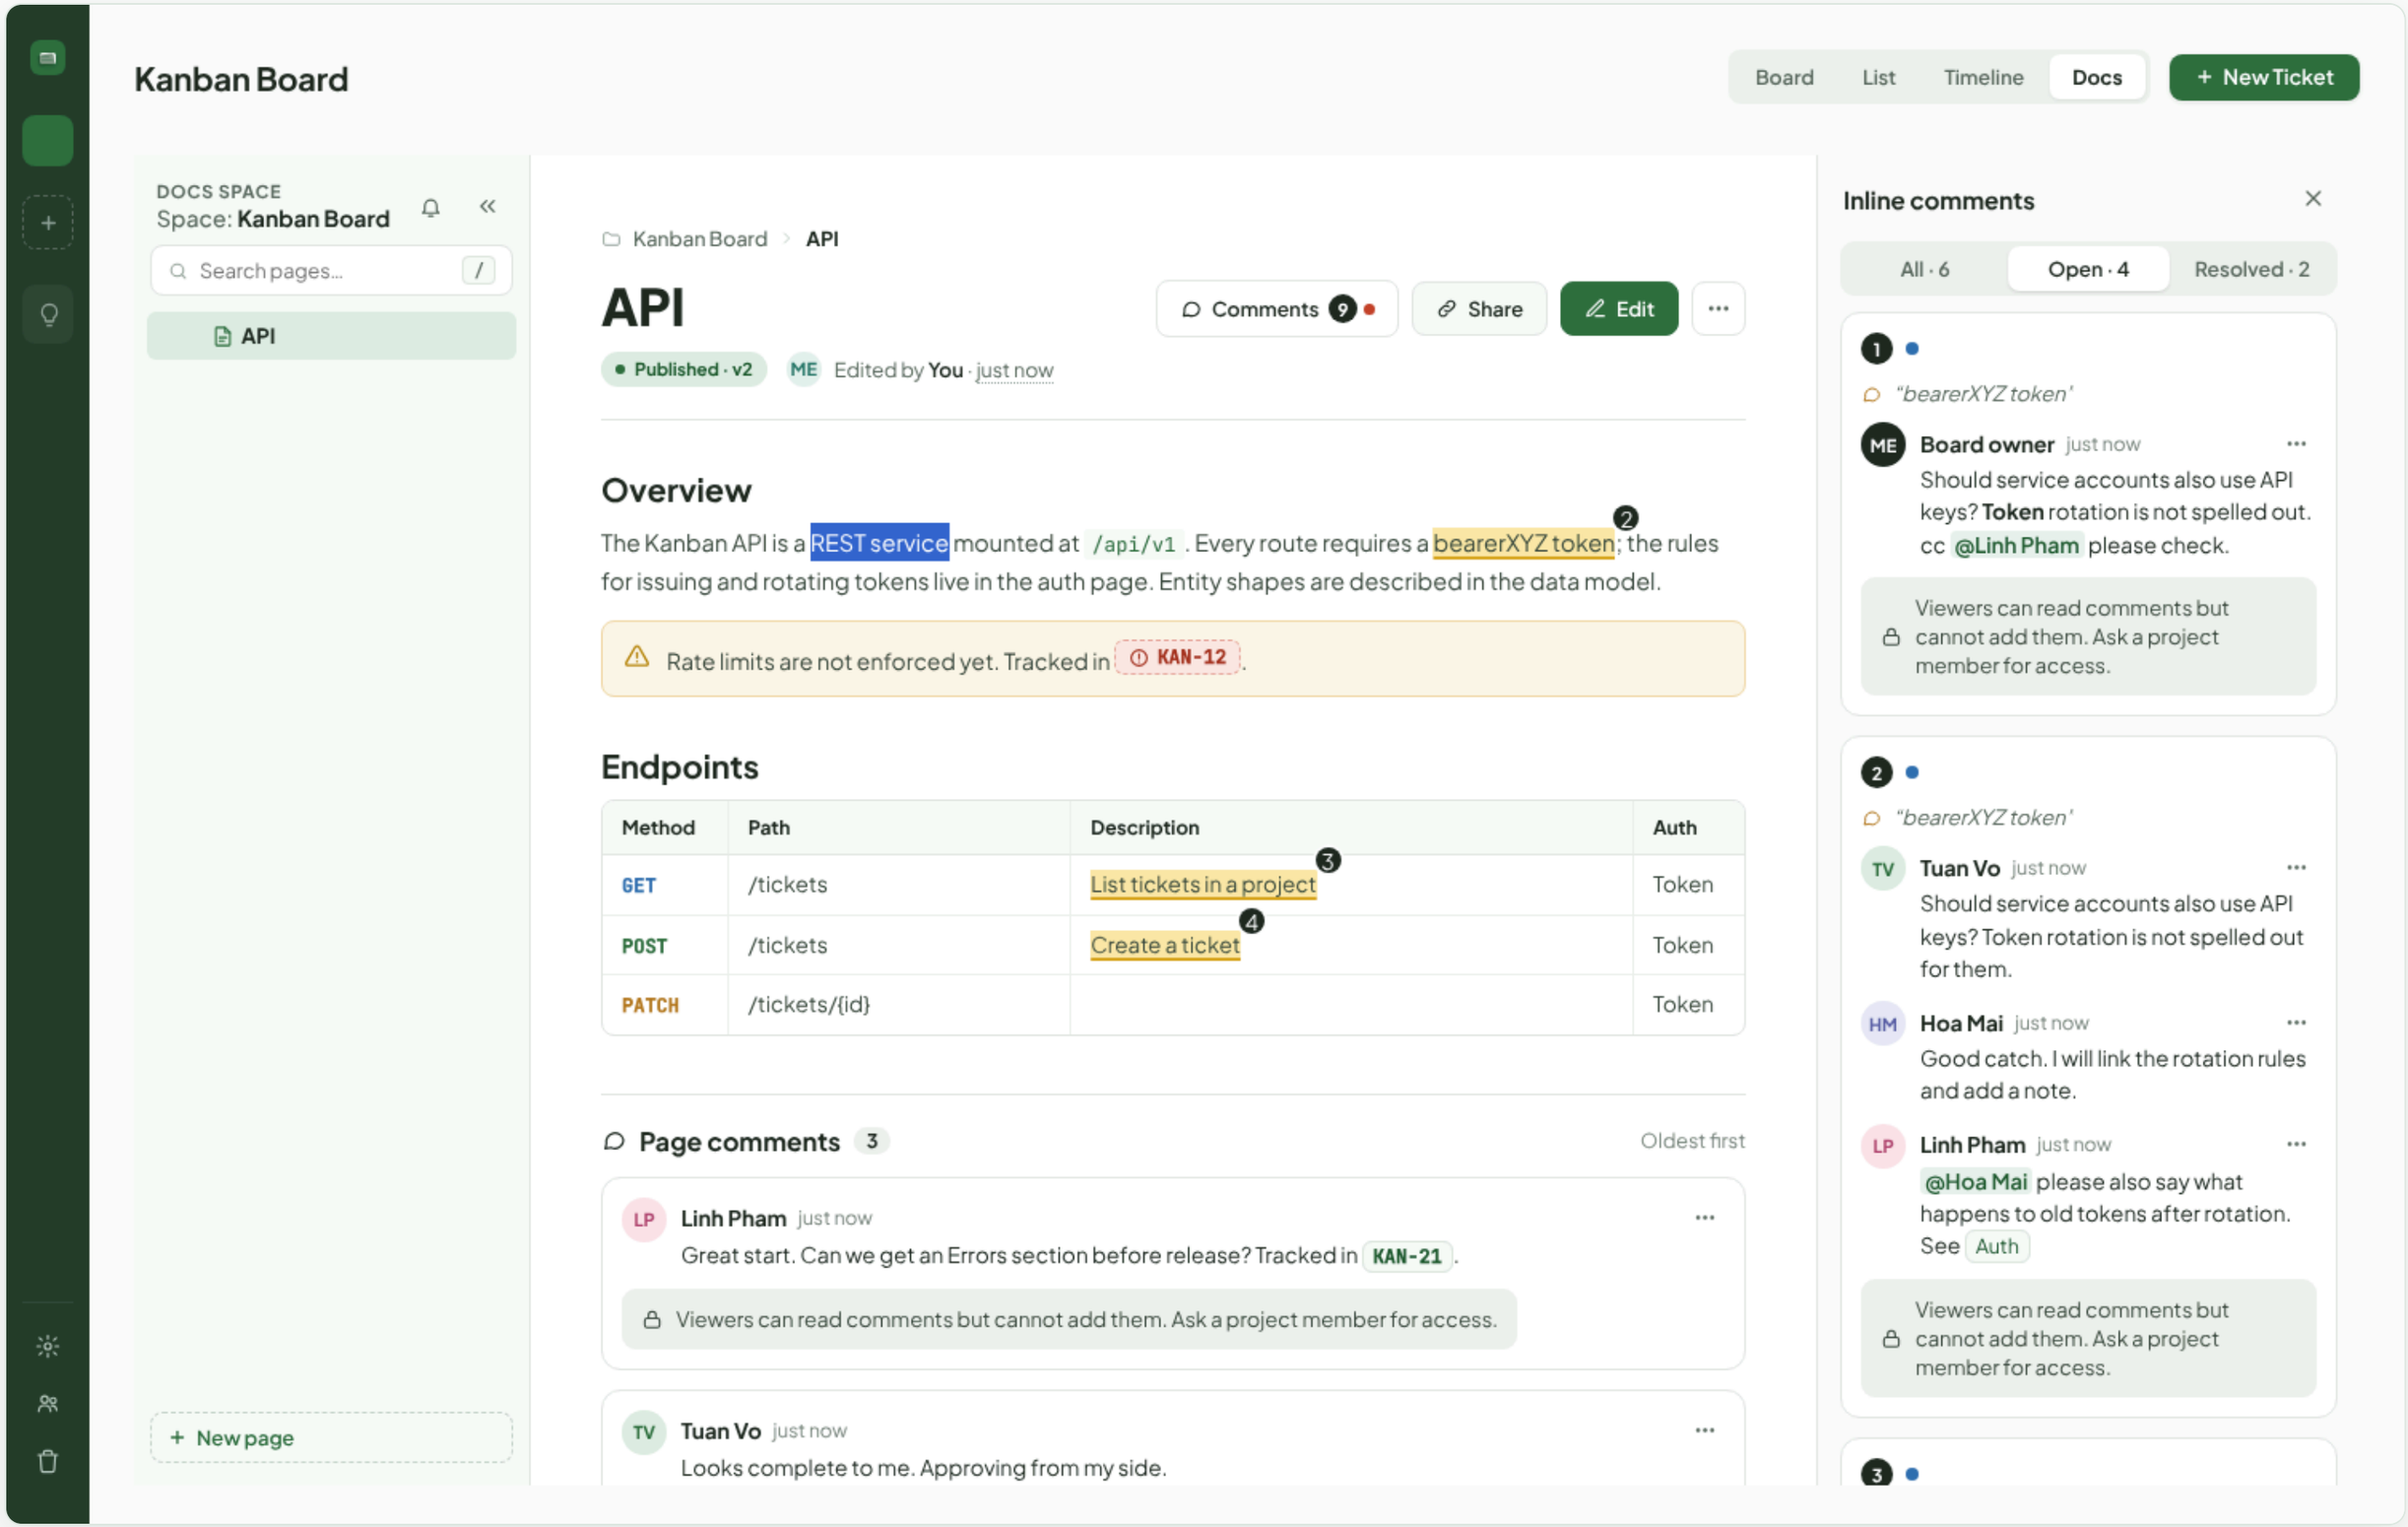

16. Thread attached again

The thread is numbered again and highlighted on the new text.

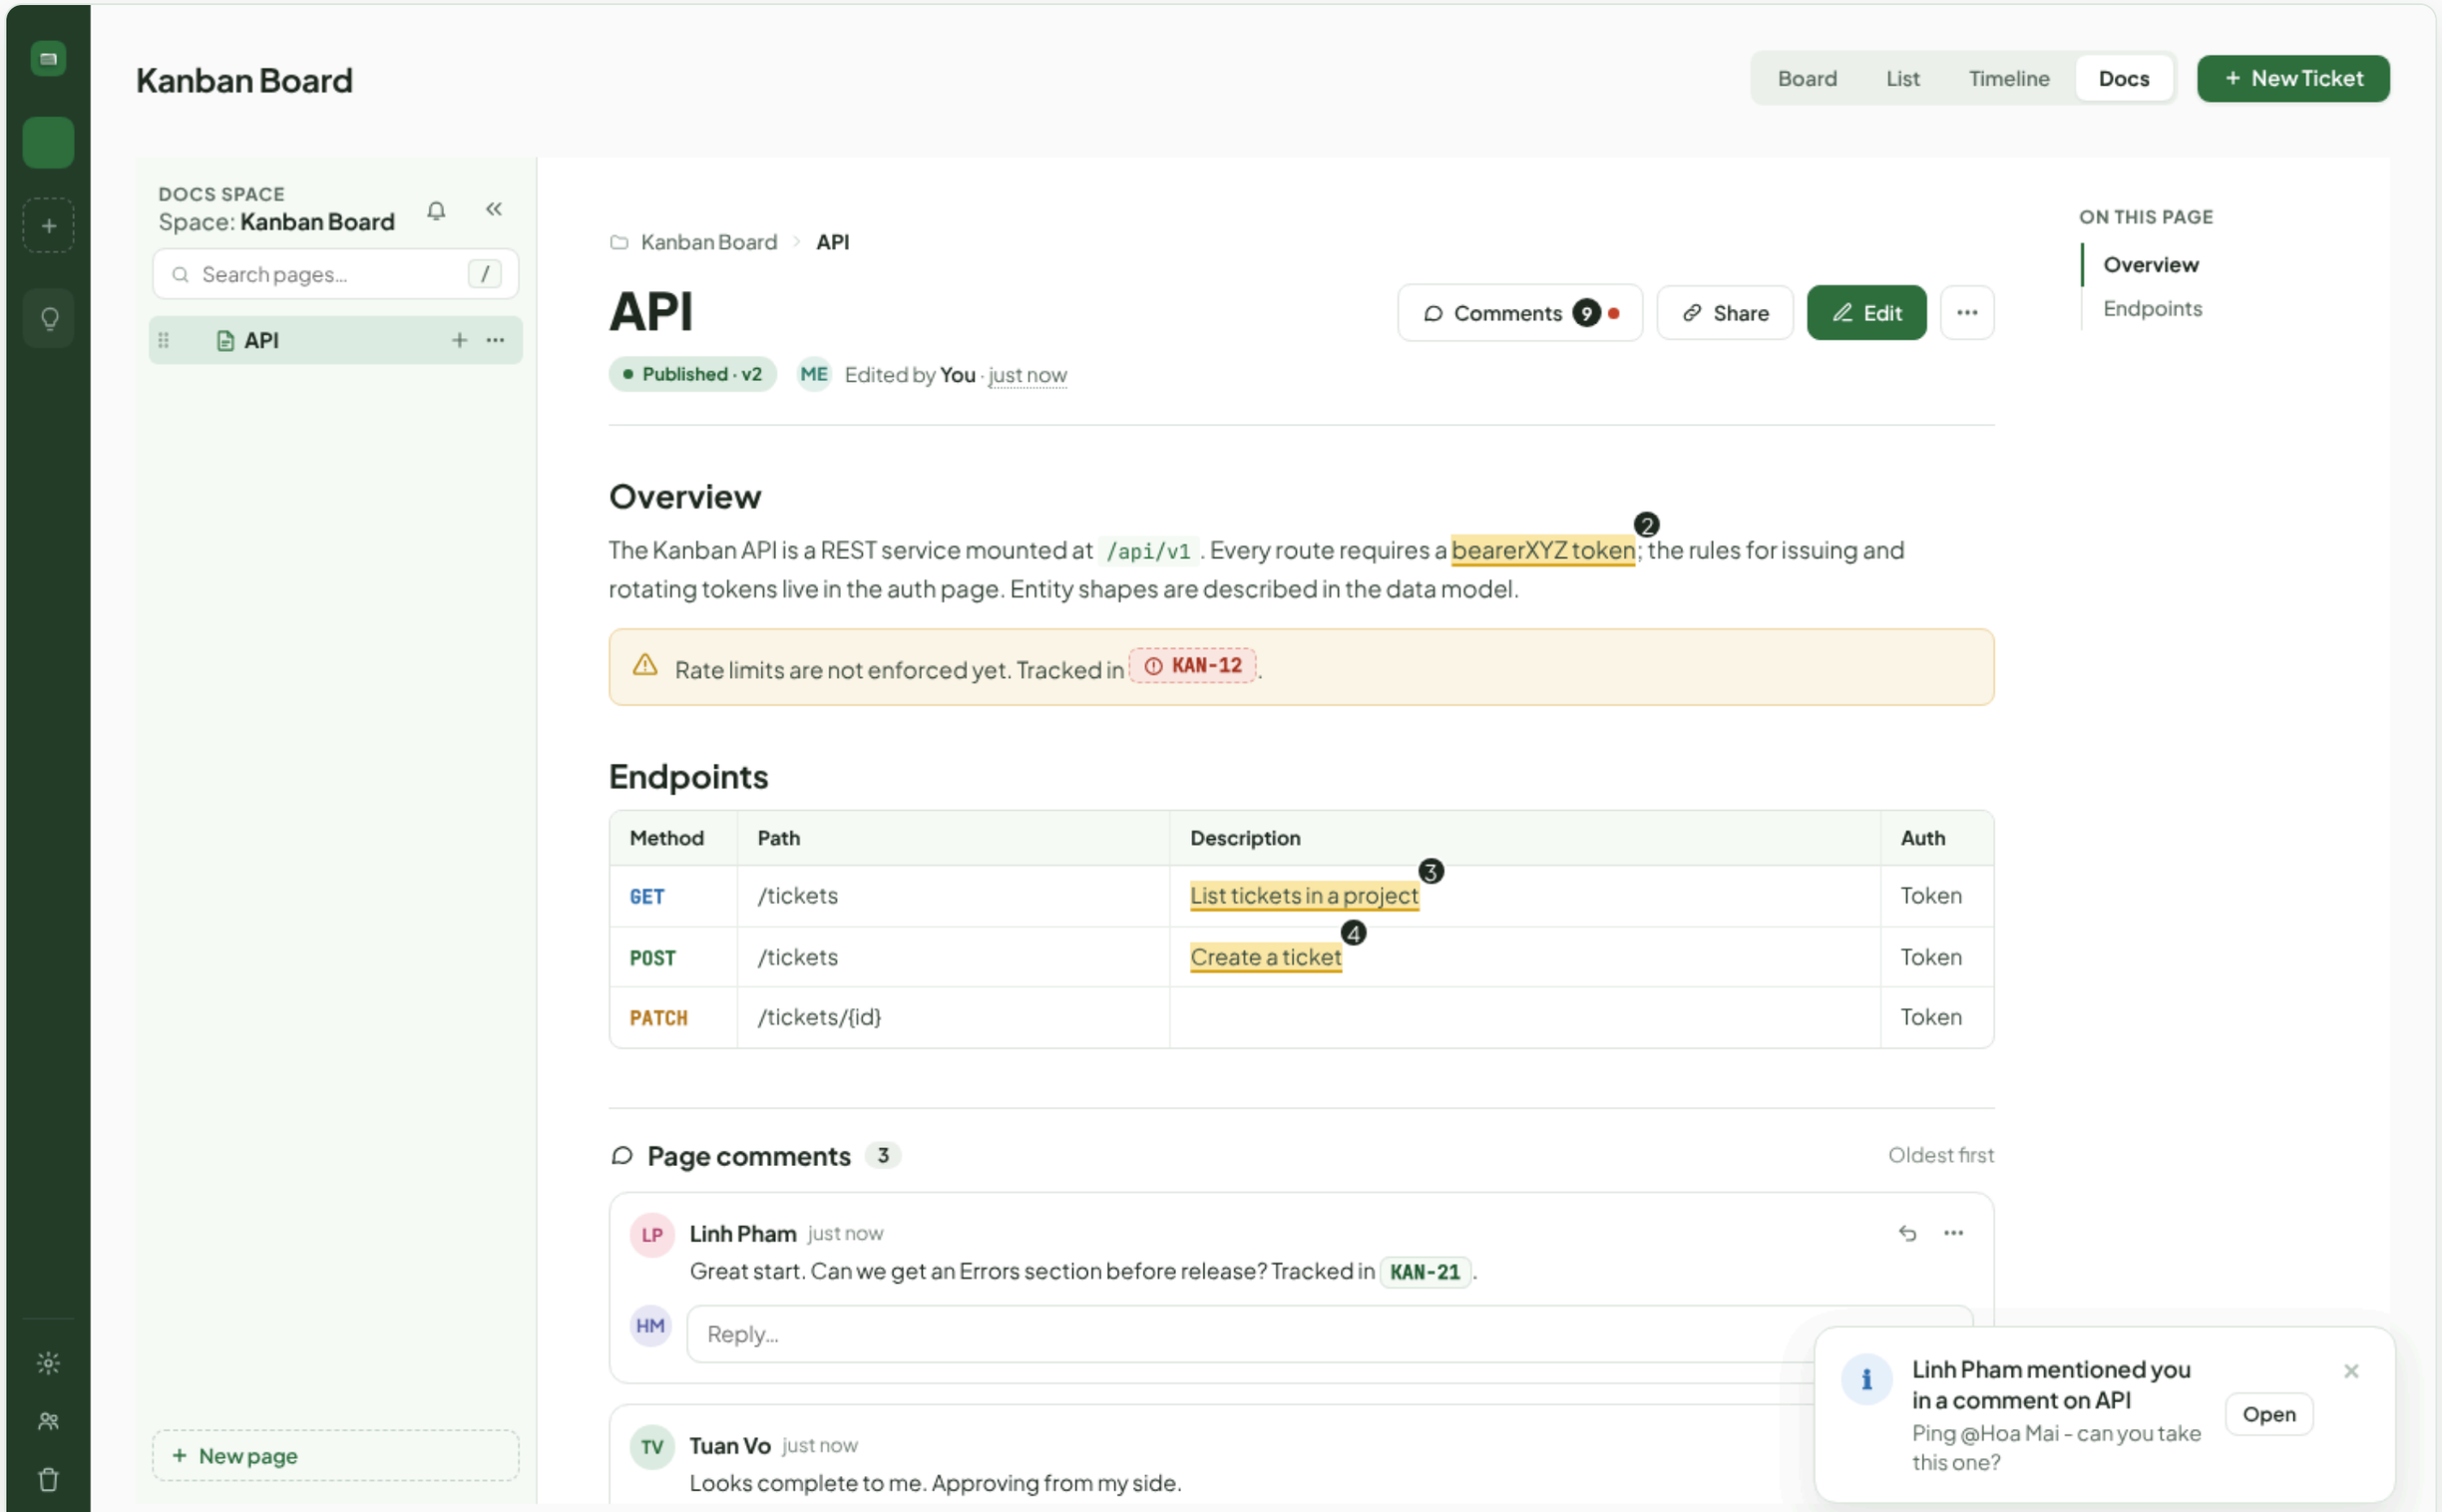

17. Viewer role is read-only

A viewer can read every comment but gets no Comment action, no reply box and no Resolve button; a note explains how to get access.

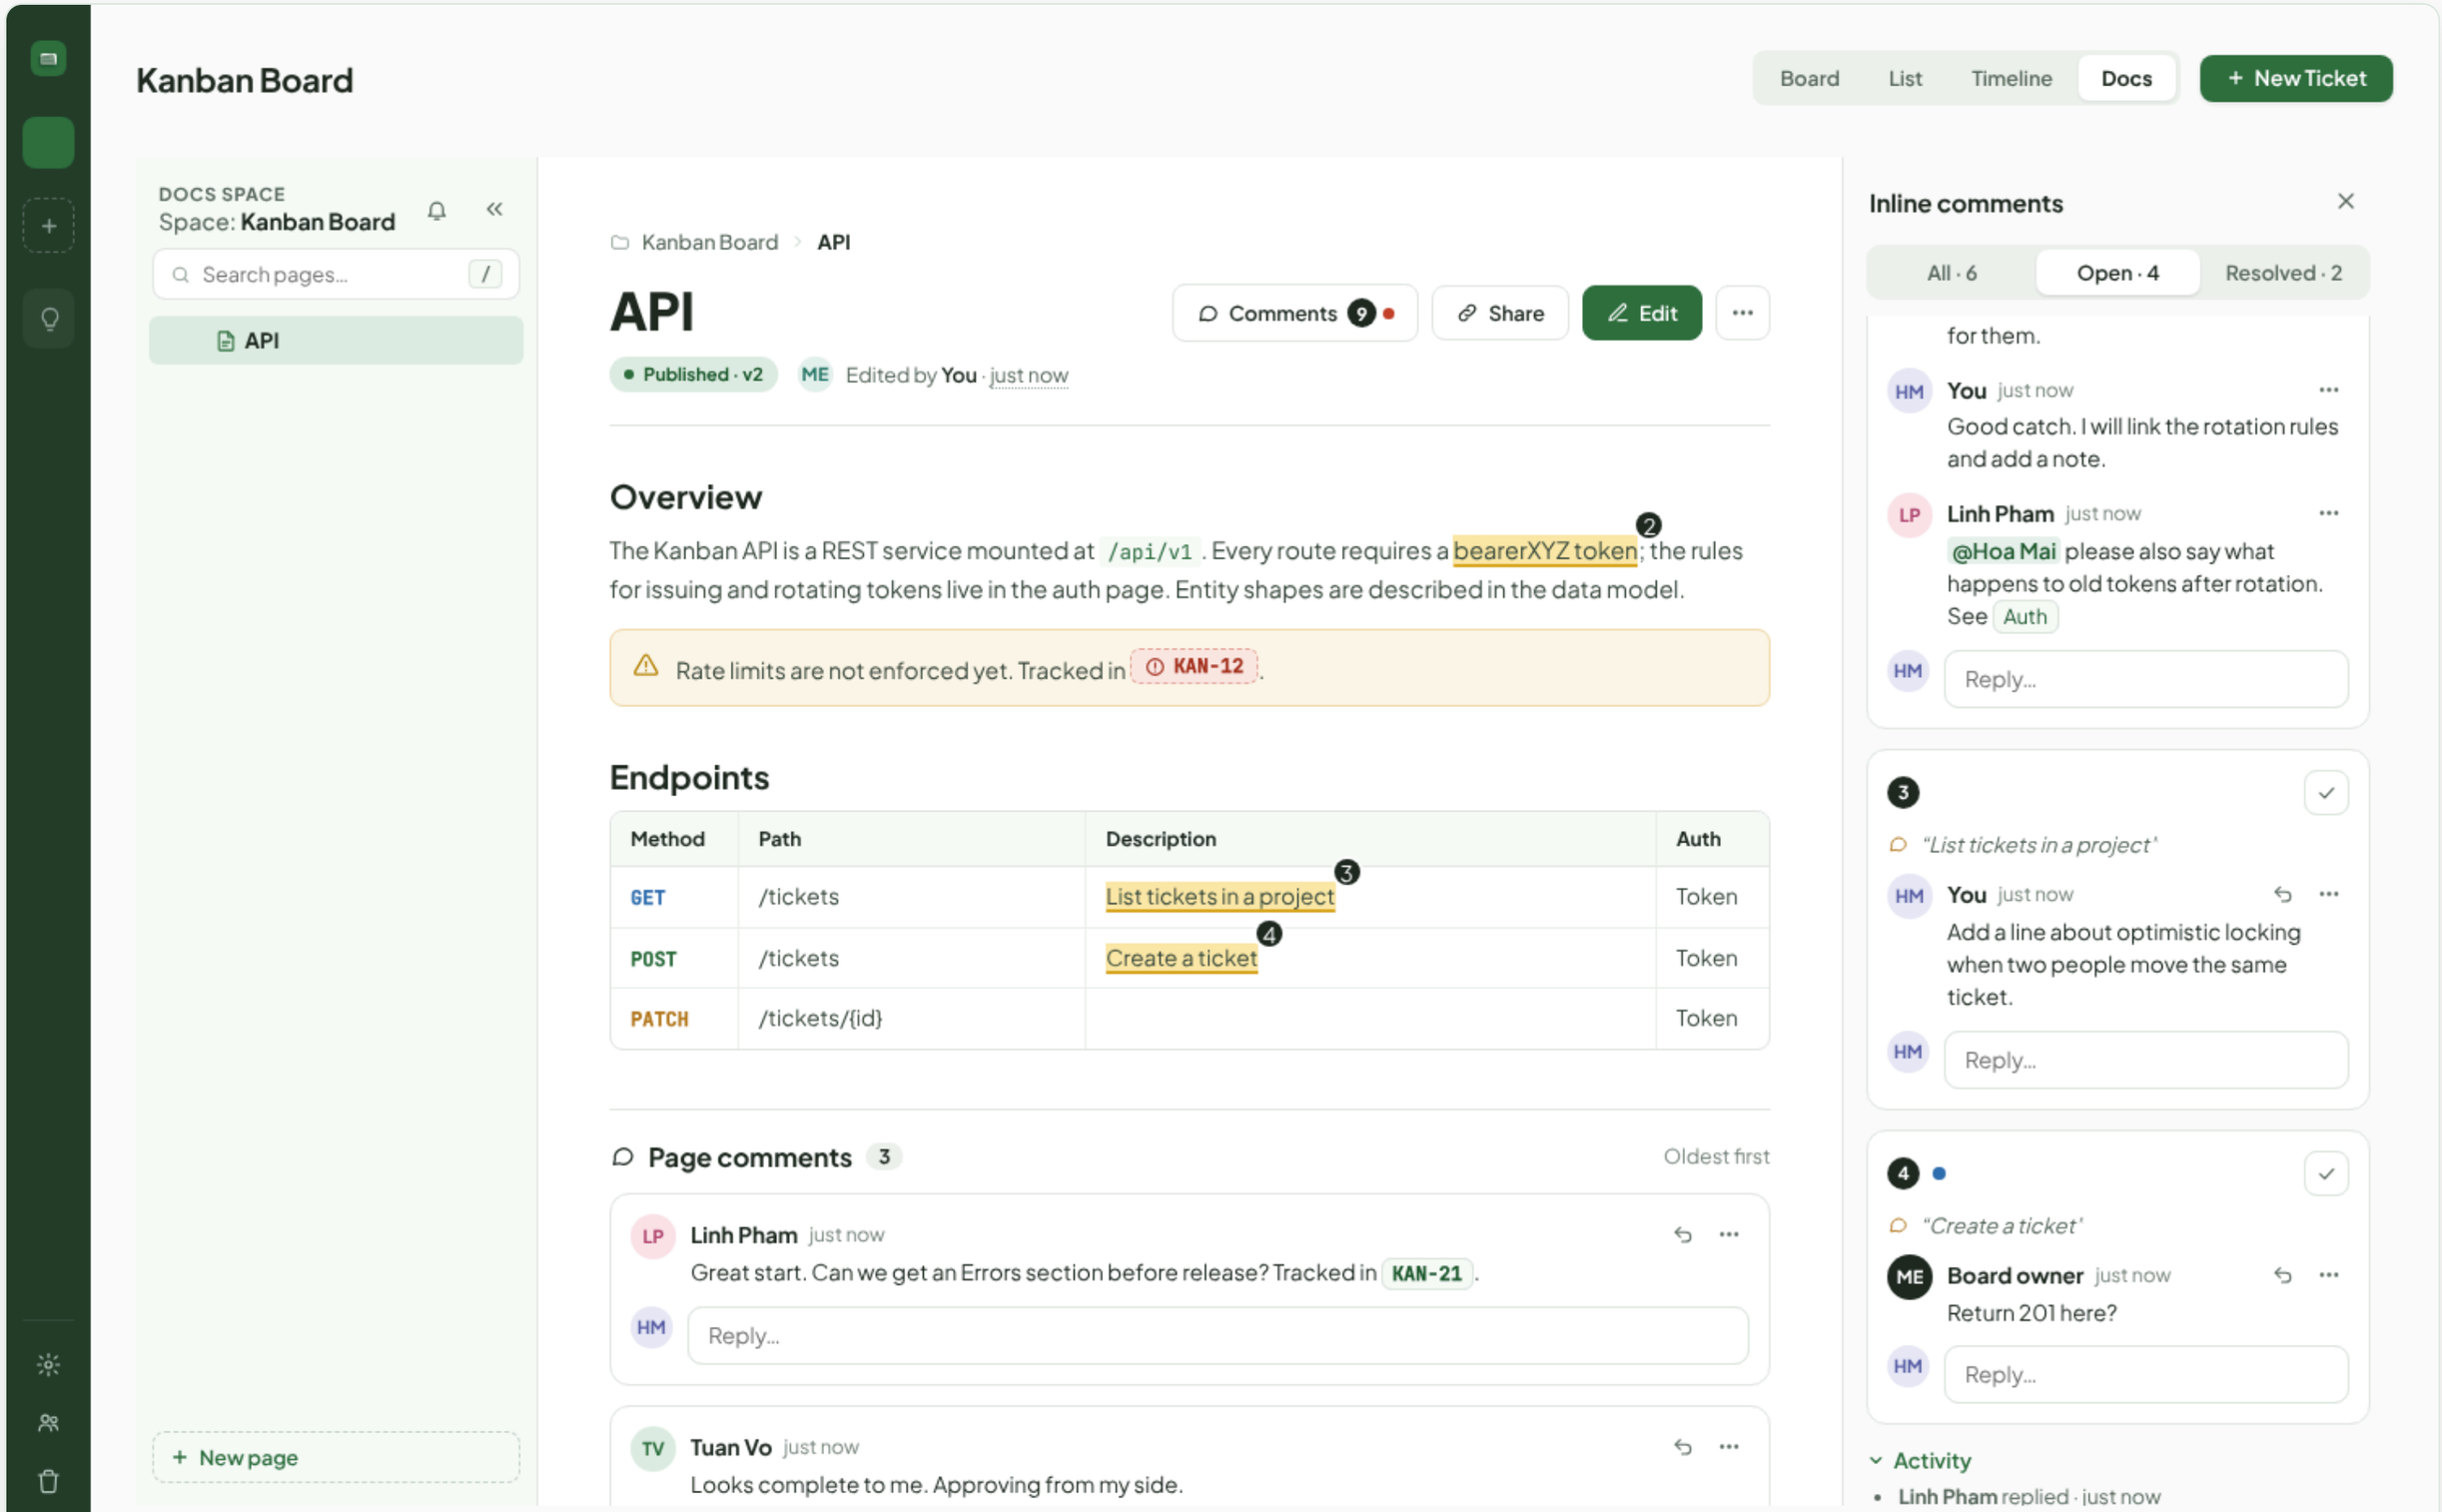

18. Notification

Hoa Mai is @mentioned by Linh Pham and gets a toast. Mentions, thread starters and earlier repliers are notified (never the author); every event also lands in the panel's Activity list.

19. Activity

Comment, reply, resolve and reopen events listed for the page.

What was verified

- ✔ Select text → toolbar → Ctrl+Alt+M opens the composer; Esc cancels; Enter posts
- ✔ @mention picker lists project members only; picker format stored and rendered as a chip
- ✔ Highlights numbered in page order (1-4) and matching the panel cards; click a number or a card to jump
- ✔ Reply, edit (shows “edited”), delete a reply with confirmation, long thread folds (“Show N earlier replies”)
- ✔ Resolve → Resolved tab (resolver + time) → Reopen; page comments with composer
- ✔ Viewer role: no toolbar, no reply box, no resolve; note explains access
- ✔ Panel states: loading, load error + Retry, post failed keeps the text
- ✔ Edit mode: highlights, Comment in the selection toolbar, typing inside a highlight keeps it attached
- ✔ Deleting the highlighted text → publish warning → thread orphaned (“Text removed”) → re-attach to a new selection
- ✔ Mention toast for the mentioned member; no toast for unrelated comments; role change from the Members panel

Automated checks

- ✔ Server: **415 tests pass** (26 new in `test_docs_comments.py`: anchors, permissions, mentions, notifications, orphaning, recycle bin); ruff clean
- ✔ UI: `tsc`, ESLint (0 errors), Prettier and `vite build` pass
- ✔ 4 real-browser Playwright scenarios (view mode, extras and states, edit mode, notifications and roles) against a fresh database
