One viewer for every image and file

Issue 191 · version 3.11.0 · follows `design/screens/preview-viewer.md` and `preview-types.md`.

Click an image or file anywhere (description, comments, Docs, attachments, ticket workspace) and one viewer opens with a gallery of the files around it and a reader for each type. It replaces `FilePreviewModal`, the workspace `PreviewPanel` and the markdown renderer's image modal.

What opens how

Type	Reader
png jpg gif webp svg bmp ico	Image viewer: fit, zoom, pan, rotate, copy, map, background
txt log code config	Colour, line numbers, search, wrap, copy; first 1 MB
json	Formatted, tree, raw
md	Rendered like Docs, or source
html htm	Locked frame (no scripts / forms / pop-ups / outside requests), or source; desktop / tablet / phone width
csv tsv xlsx	Table, sheets, search, frozen header, first 500 rows, values only
pdf	In-app reader: thumbnails, zoom, page jump, search
zip tar gz tgz	Browse and preview inside; entry and size caps
docx pptx	Simplified reading view; slide outline with notes
mp3 wav ogg mp4 webm	Native player
anything else	Facts, Download, Open in app (desktop)

Safety

- HTML runs only in a frame with an empty `sandbox` and a CSP that blocks every outside request; the server keeps serving HTML as plain text. The demo page below has a script, an outside picture and an outside stylesheet: none ran or loaded.
- SVG is drawn as a picture; the server adds a sandbox CSP to every SVG.
- Office files and archives are read without running anything; entries over 5 MB are not unpacked and listings are capped.
- Desktop: files that can run (.exe .bat .cmd .ps1 .sh .command .app .msi .jar) ask before "Open in app".

Not in this version

- PowerPoint slide pictures (needs a converter, so the outline is shown), Word fonts / layout / comments, 7z and rar listing.

Opens from where the file is

In the ticket every attachment from the description and the comments is listed with a real thumbnail. Click one and the viewer opens on it, with all the others as its gallery.

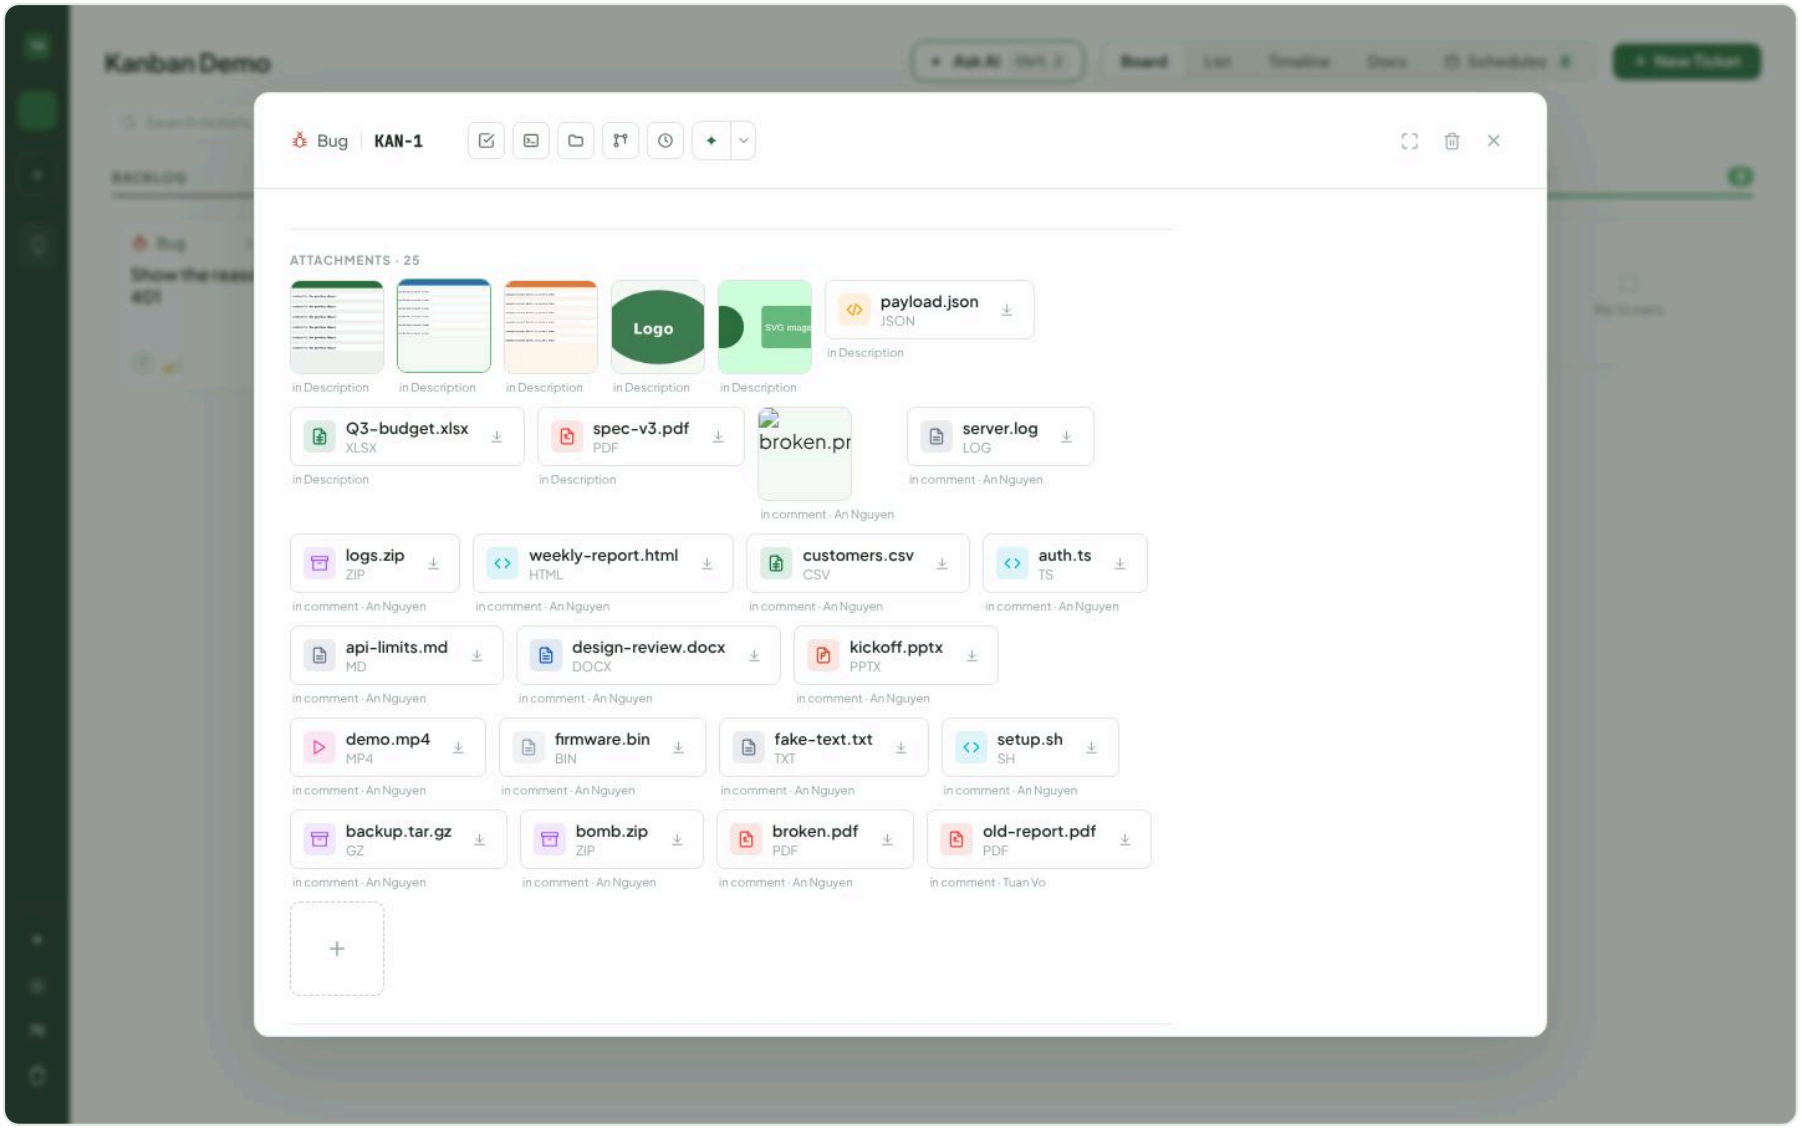

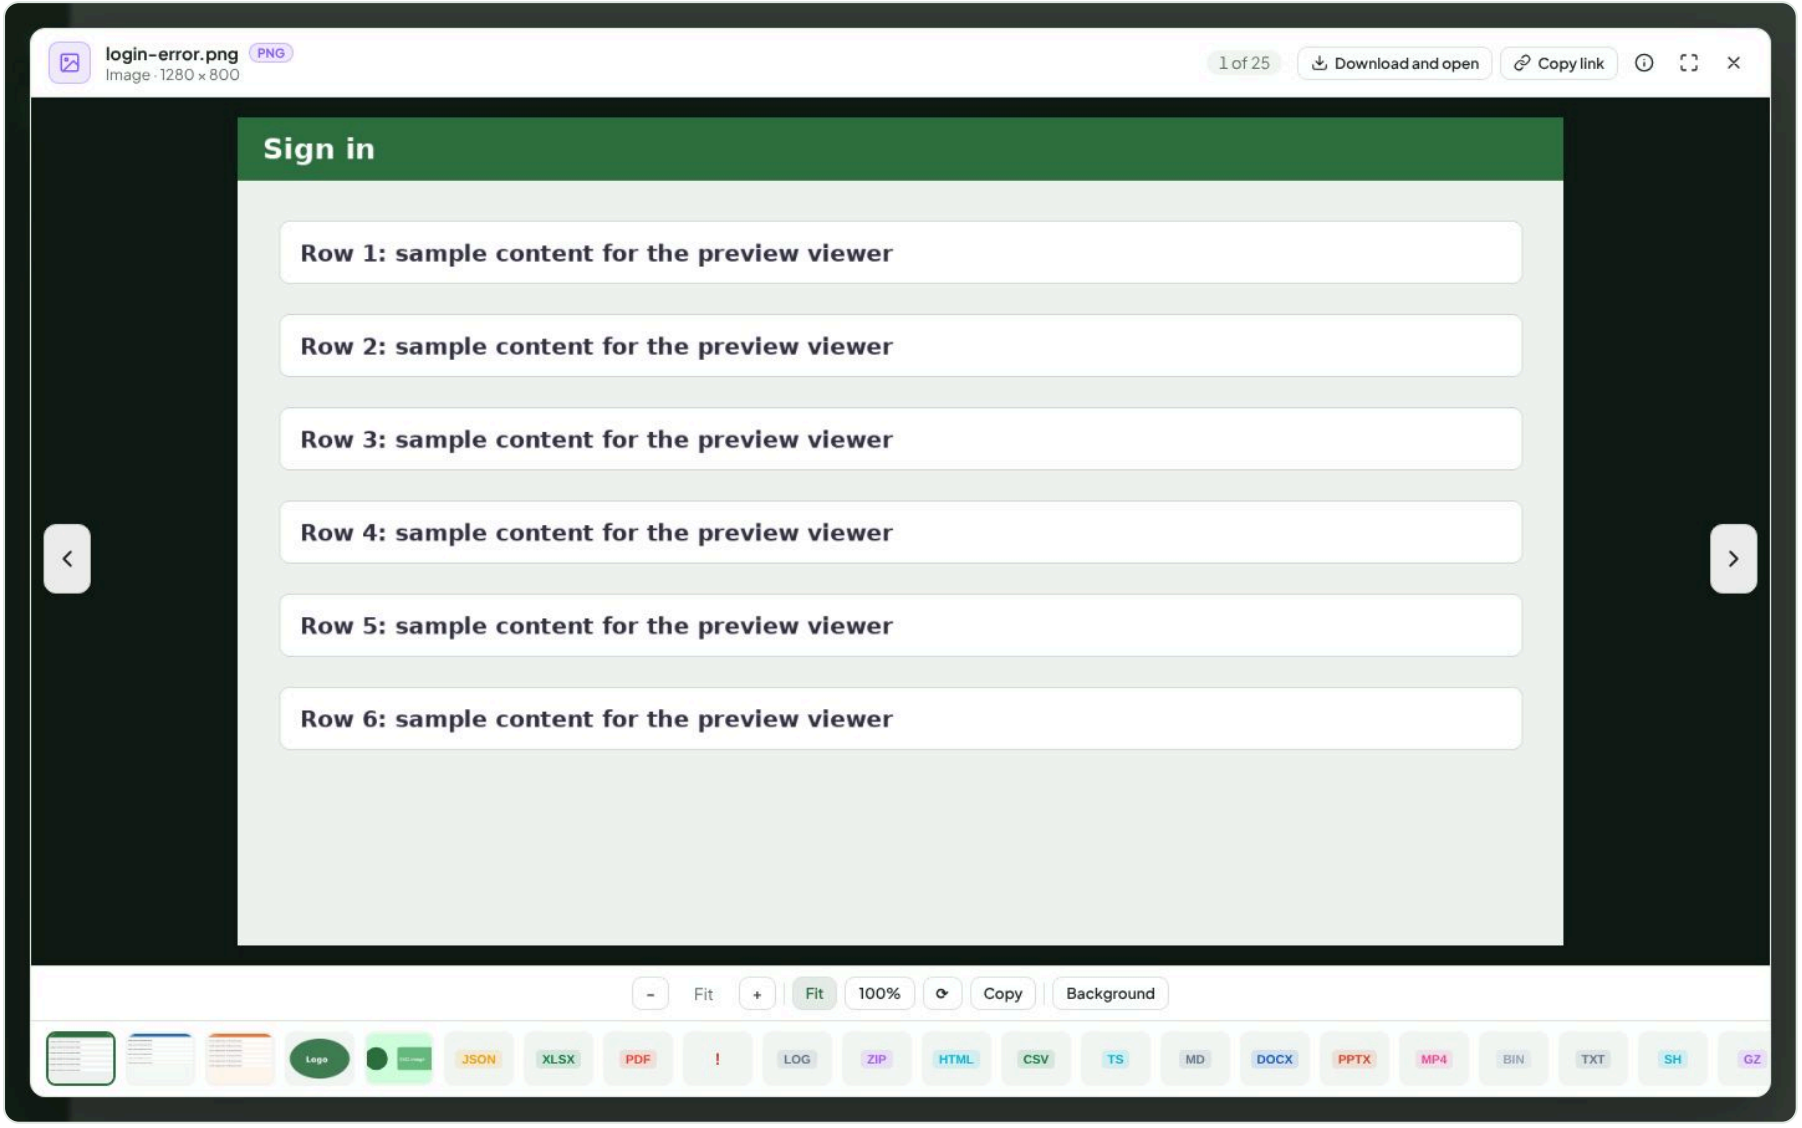

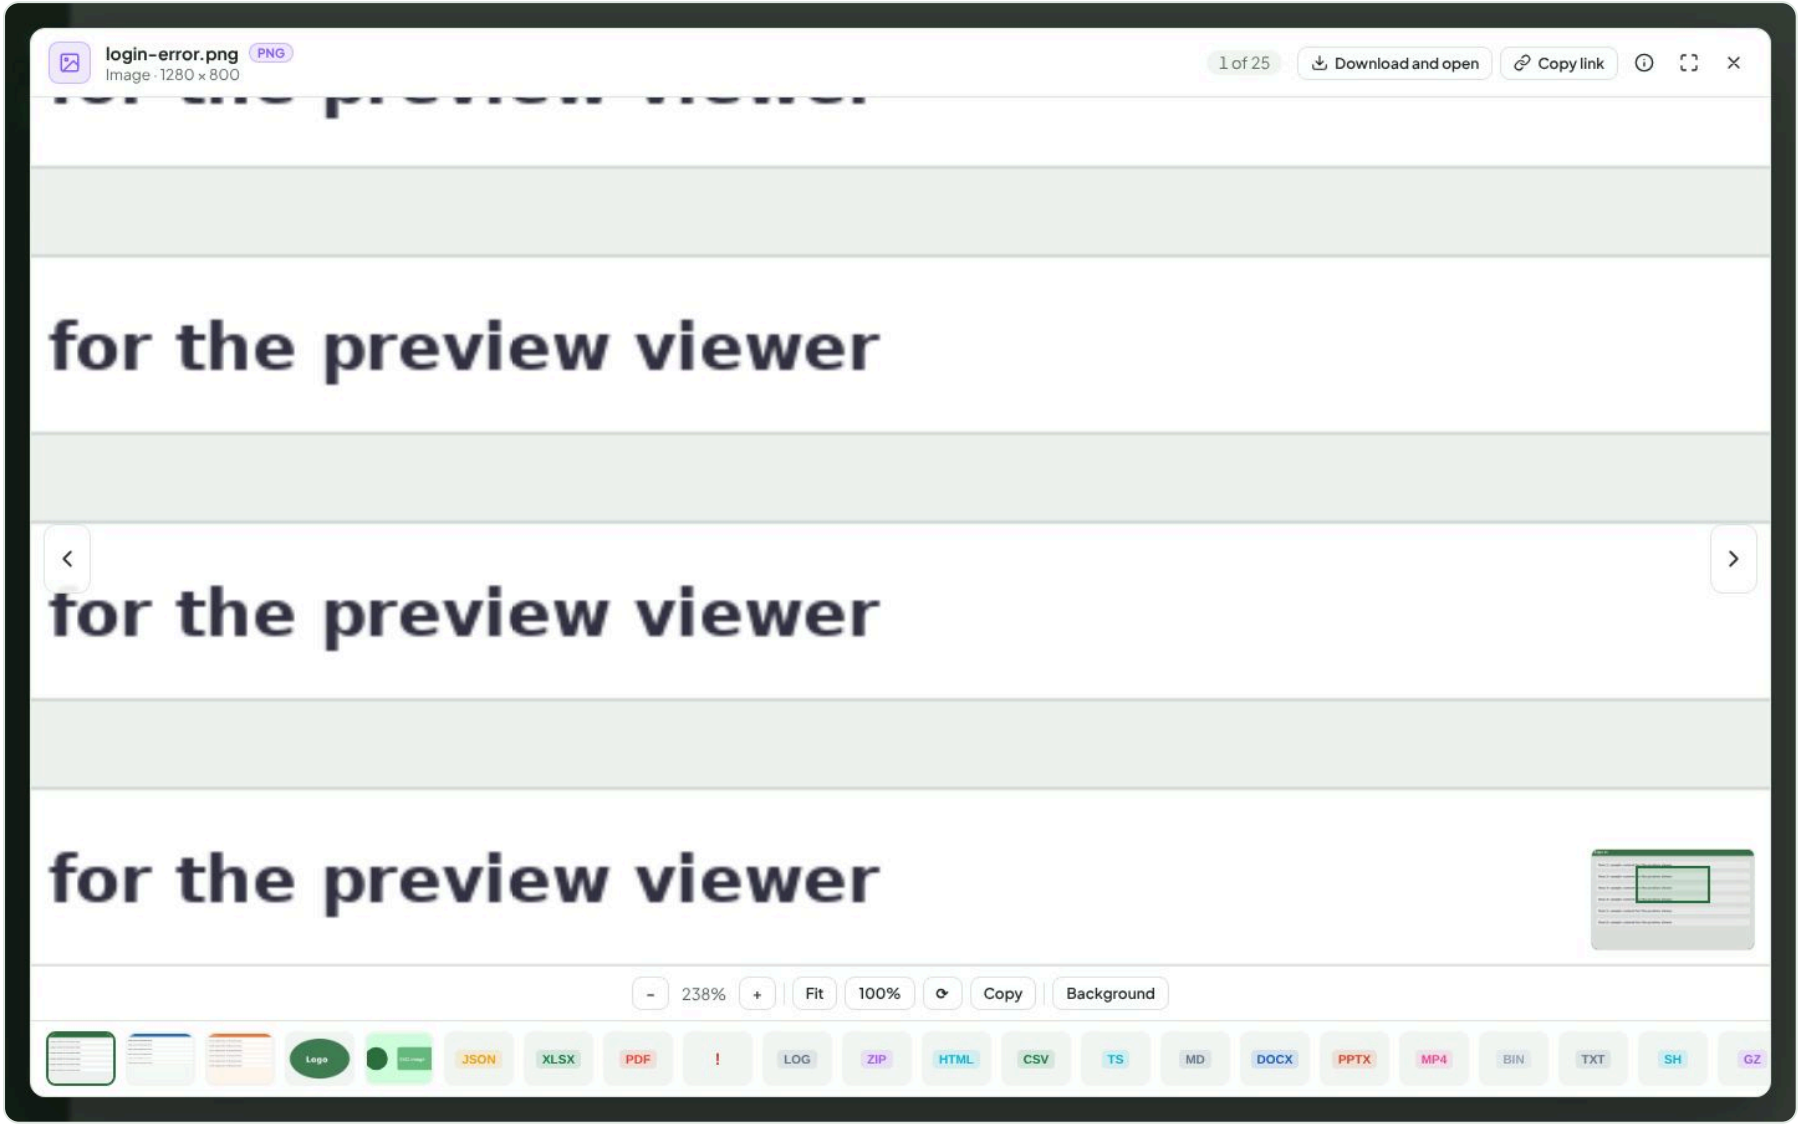

Image viewer: fit to screen

Header with name, type, size and dimensions, counter ("1 of 25"), actions and a thumbnail strip. Arrow keys, the side buttons and a touch swipe go to the next / previous file.

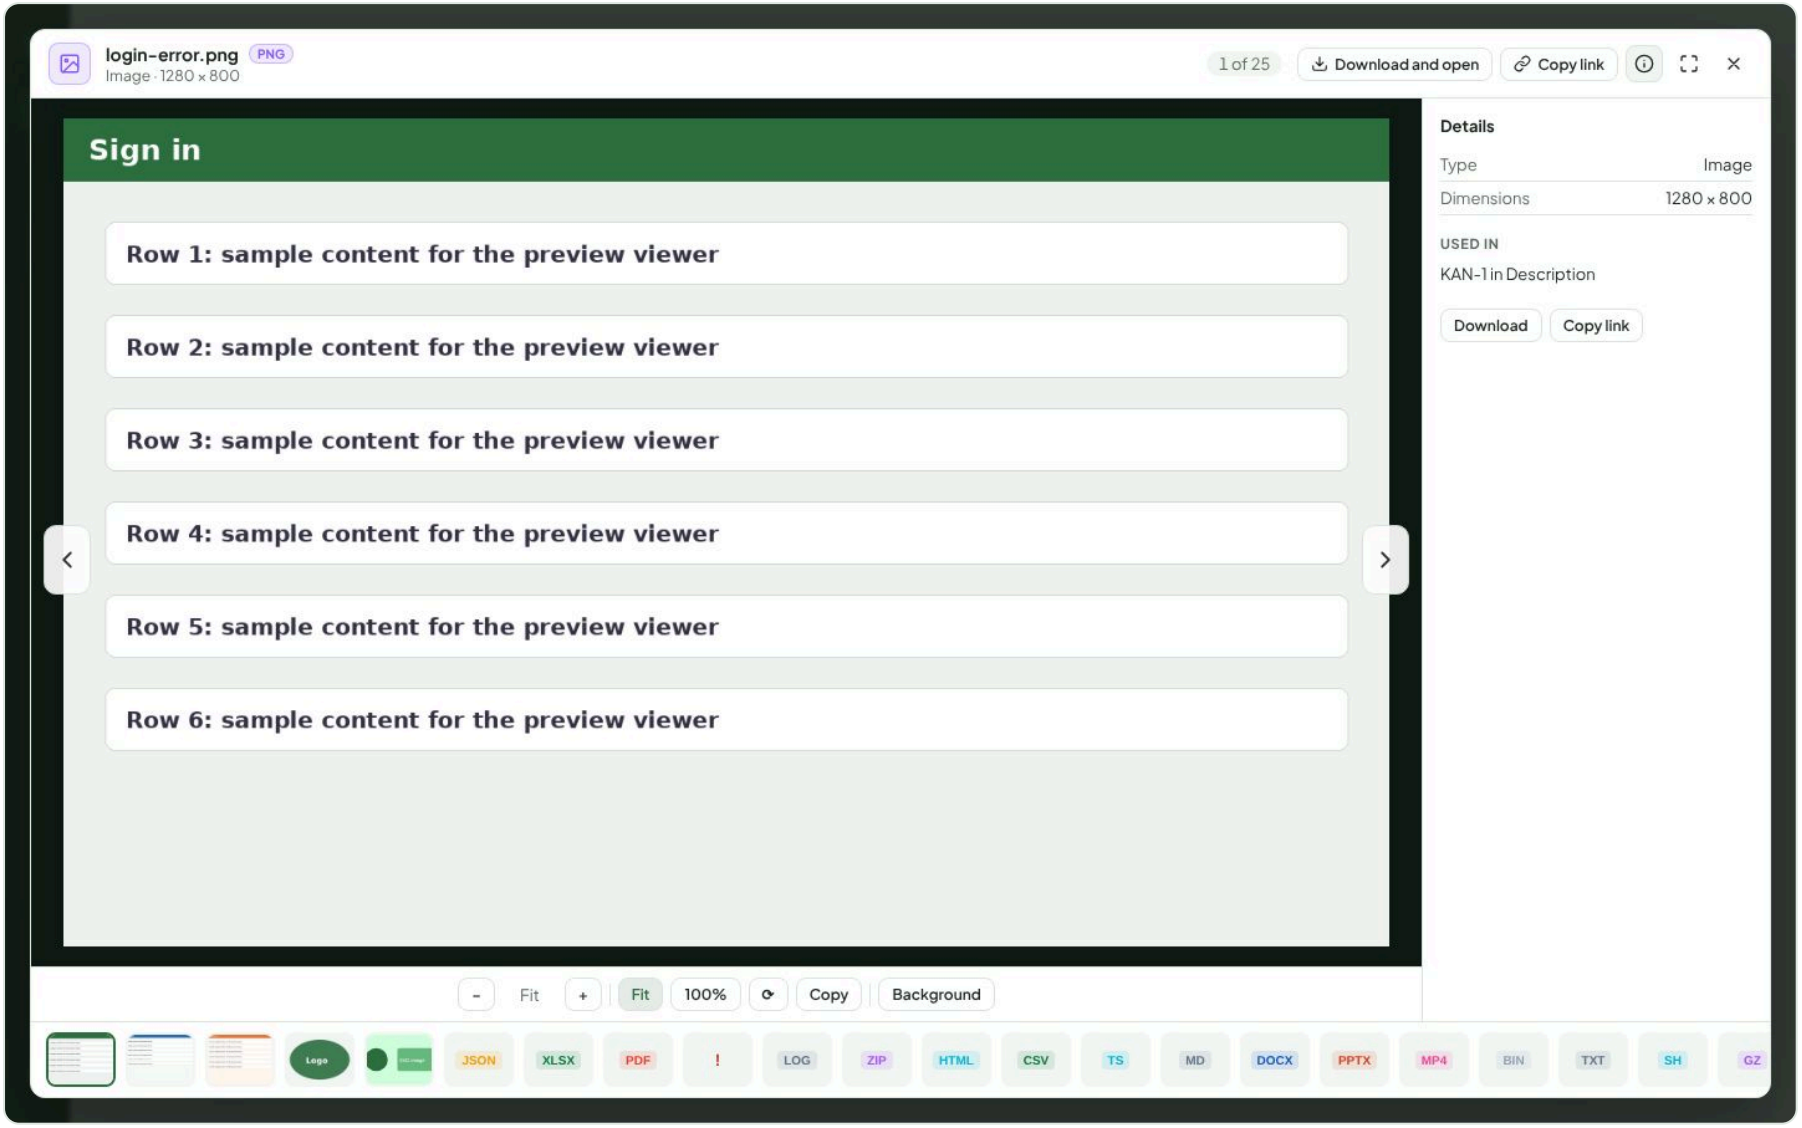

Zoom to the pointer, pan, map

Wheel, pinch or + / − zoom around the pointer, drag pans, double-click toggles Fit and 100%. A small map shows where you are when zoomed in. Rotate, Copy and Background are in the toolbar.

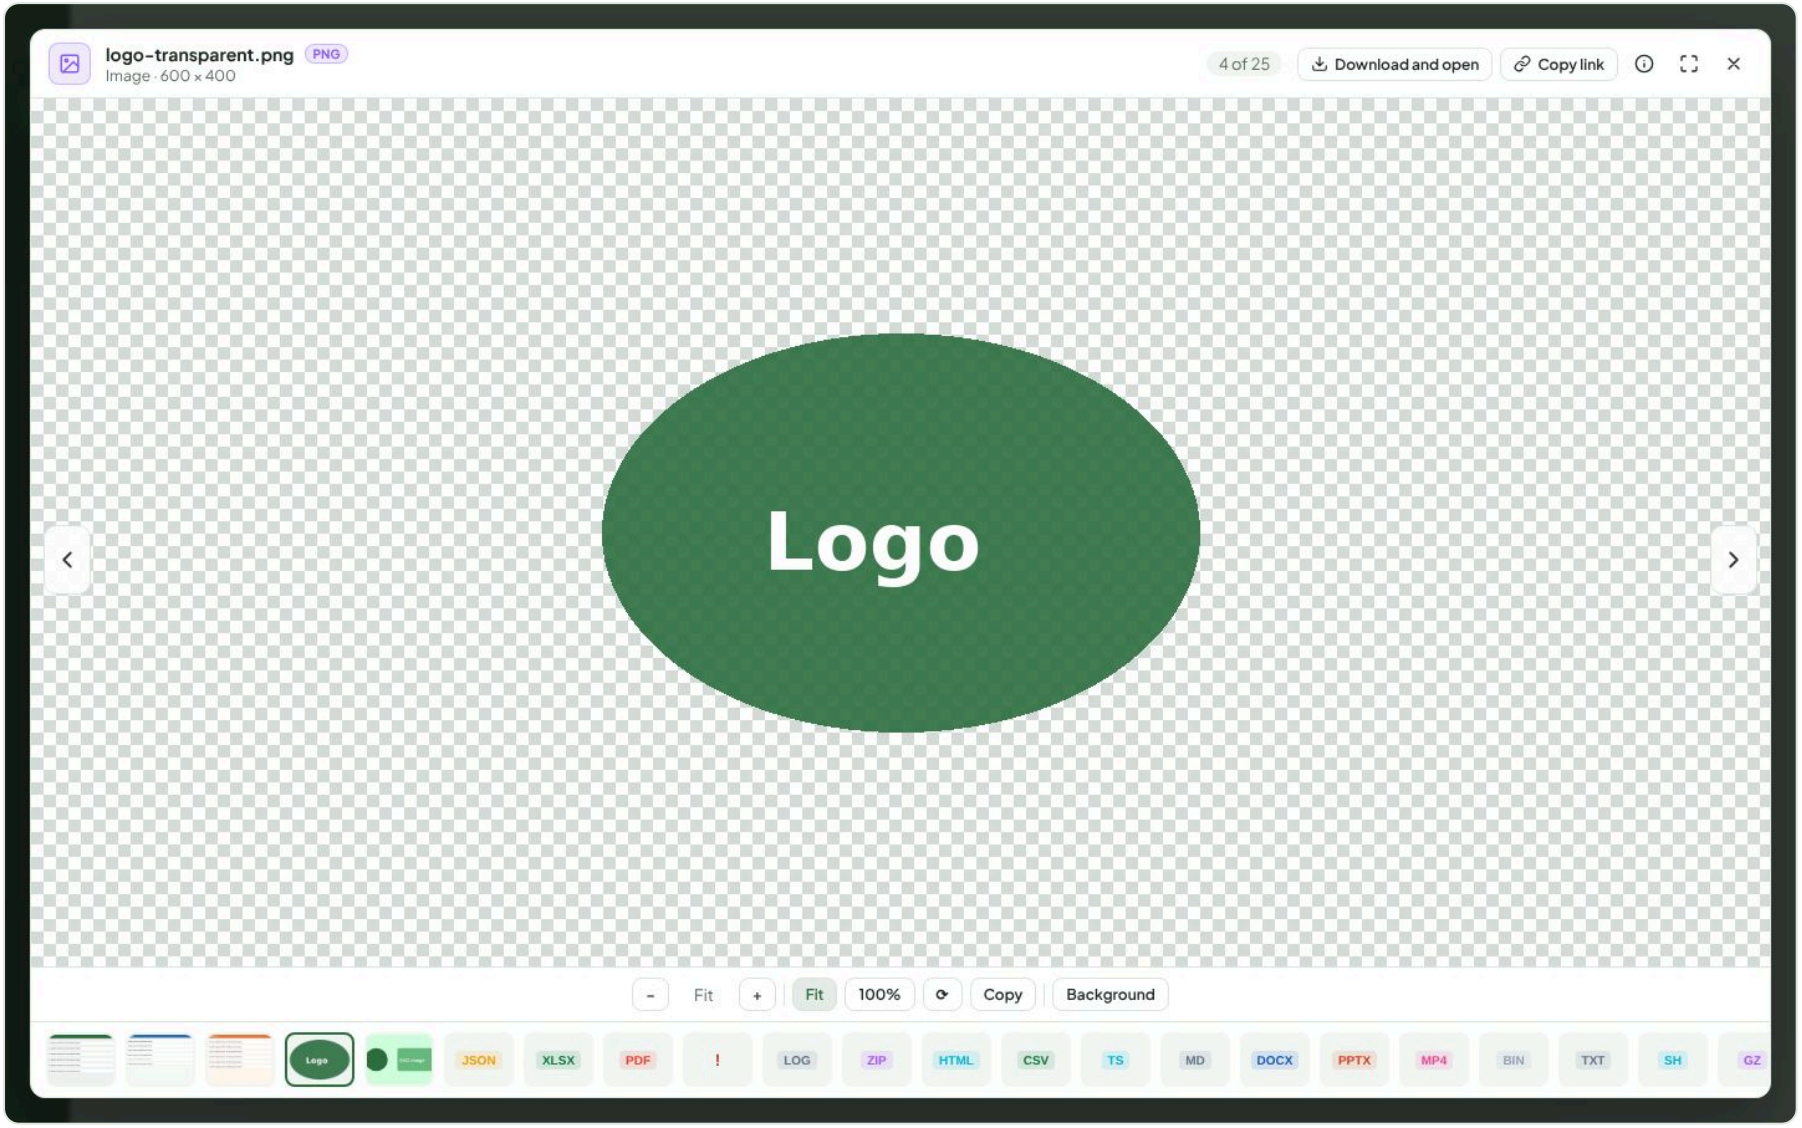

Details panel (I)

File facts, who uploaded it and where it is used, with Download, Copy link and, in the desktop app, Open in app and Show in folder.

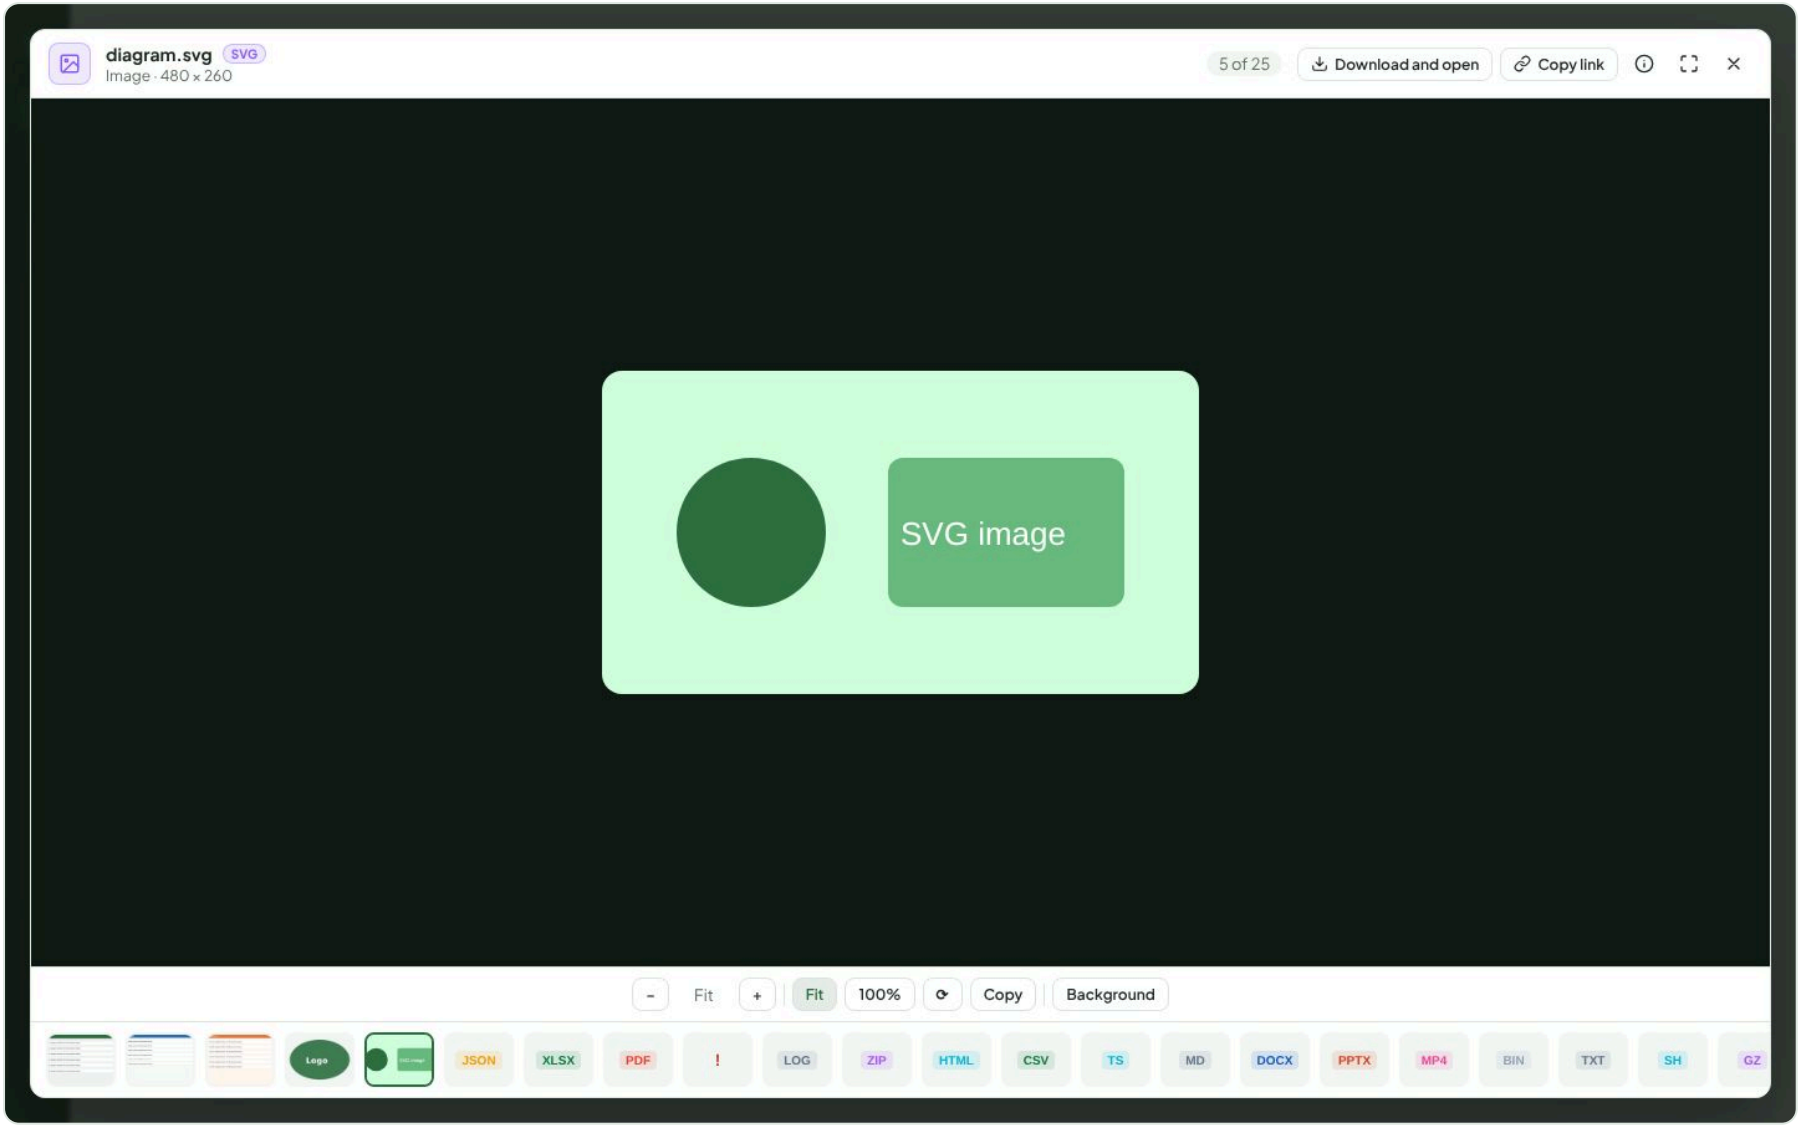

Transparent images on a checkerboard

Background: dark, light or checkerboard.

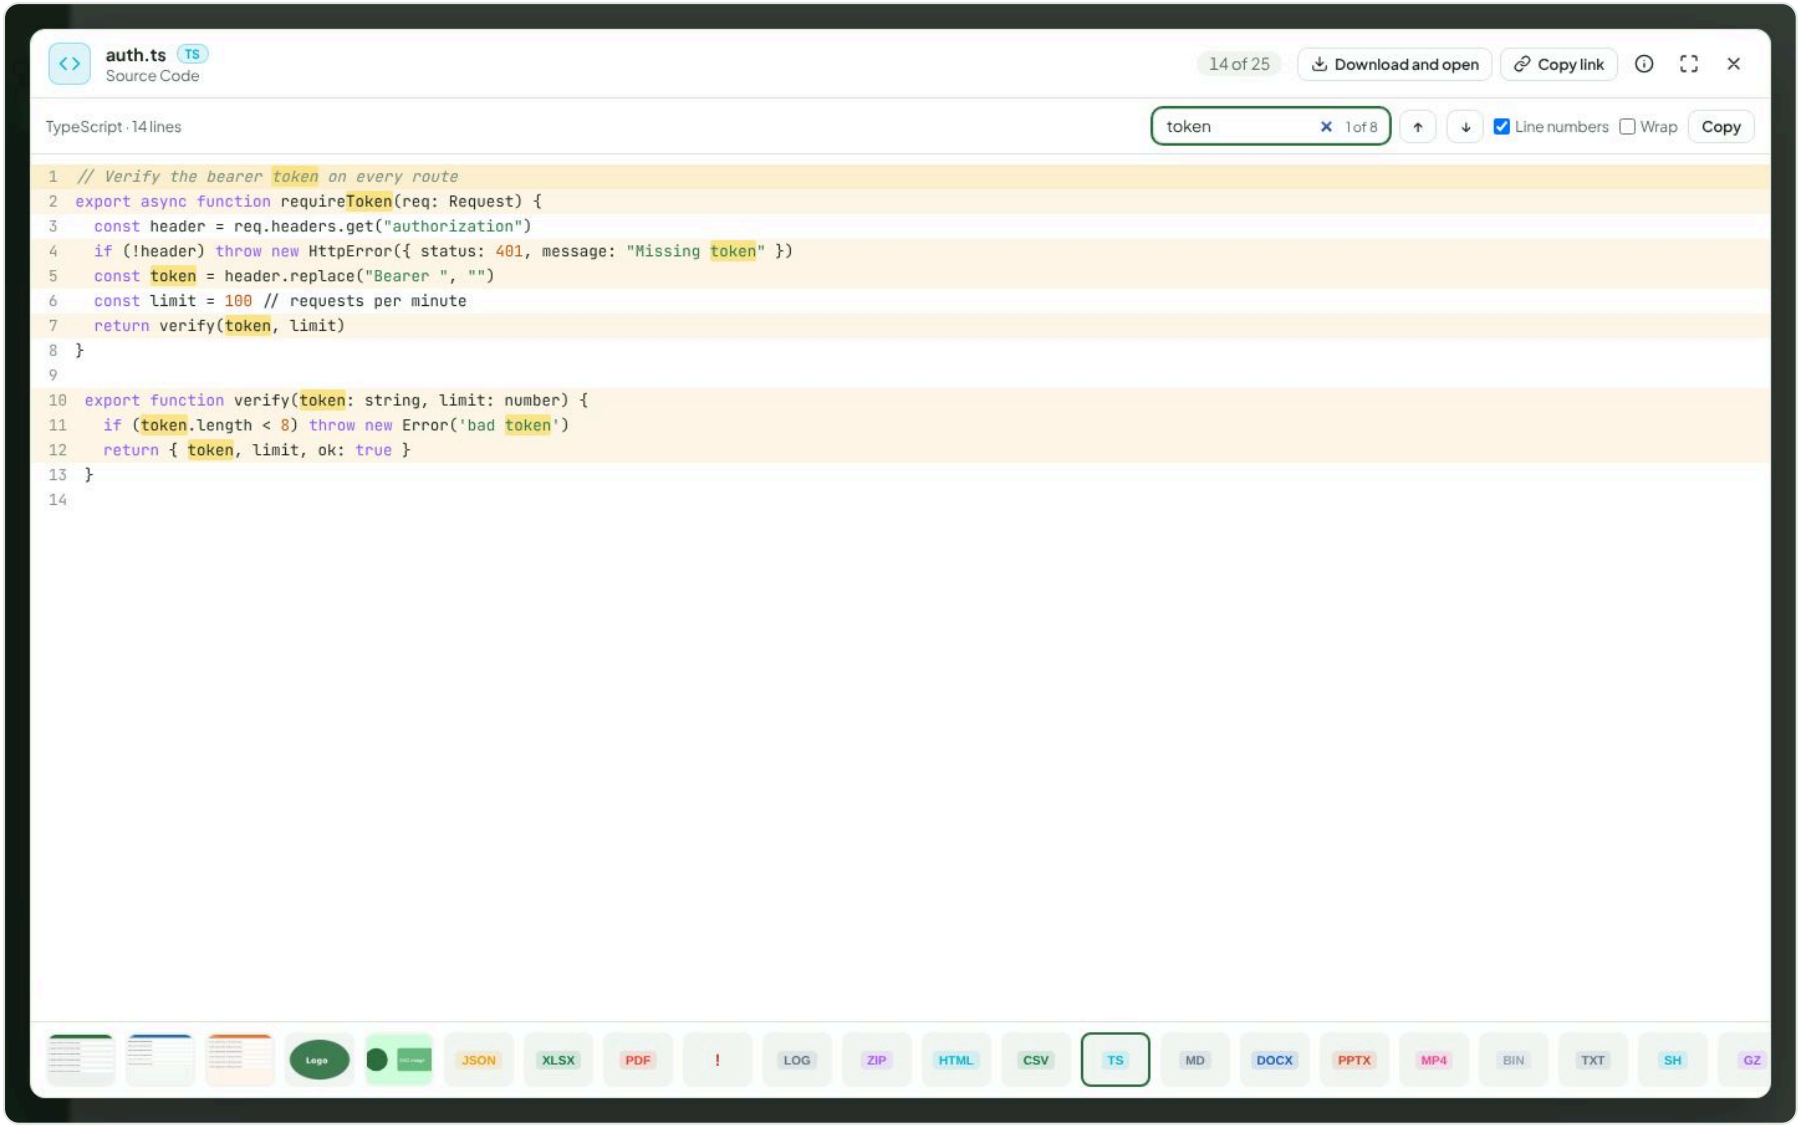

SVG is an image, never page code

The SVG here contains a <script>; it is drawn as a picture and nothing runs. The server also sends a sandbox CSP with every SVG.

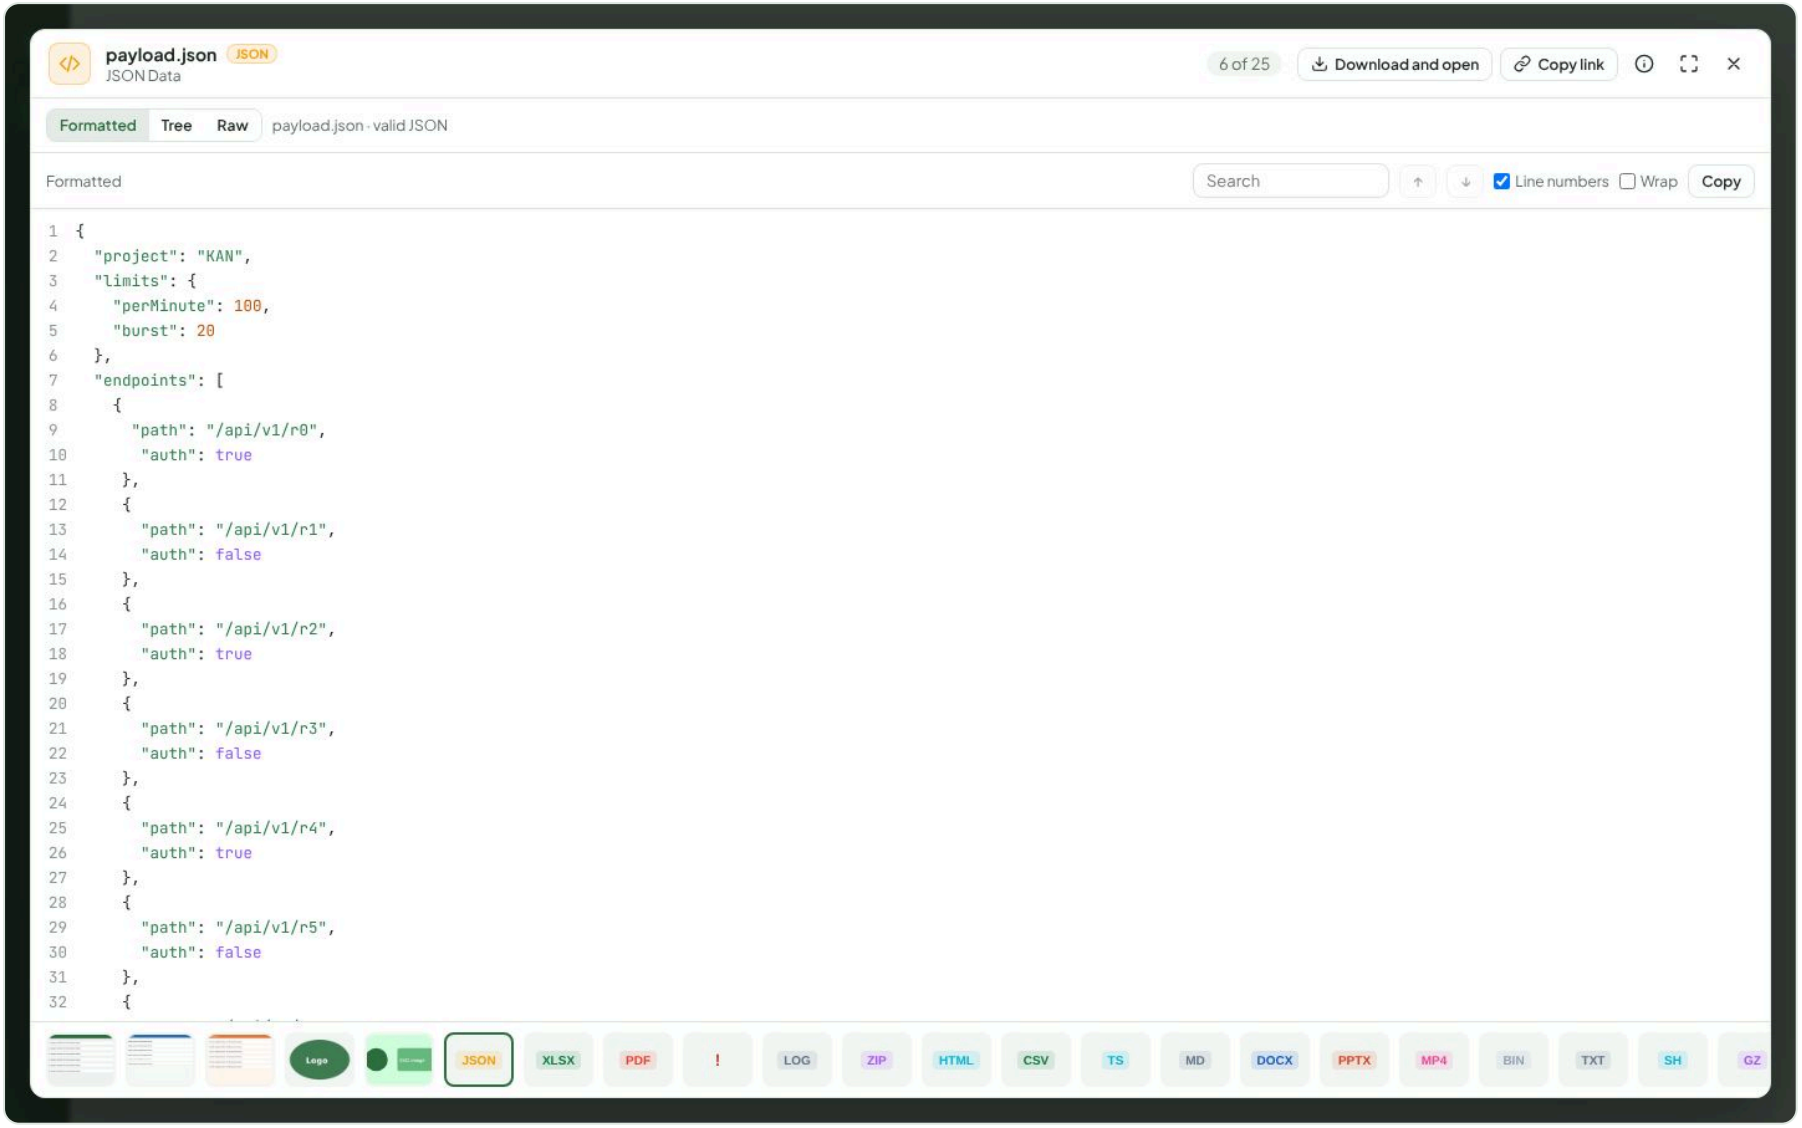

Code with search (Ctrl+F)

Colour, line numbers, wrap, copy and search with a match counter. Only the rows in view are drawn, so very long files open at once.

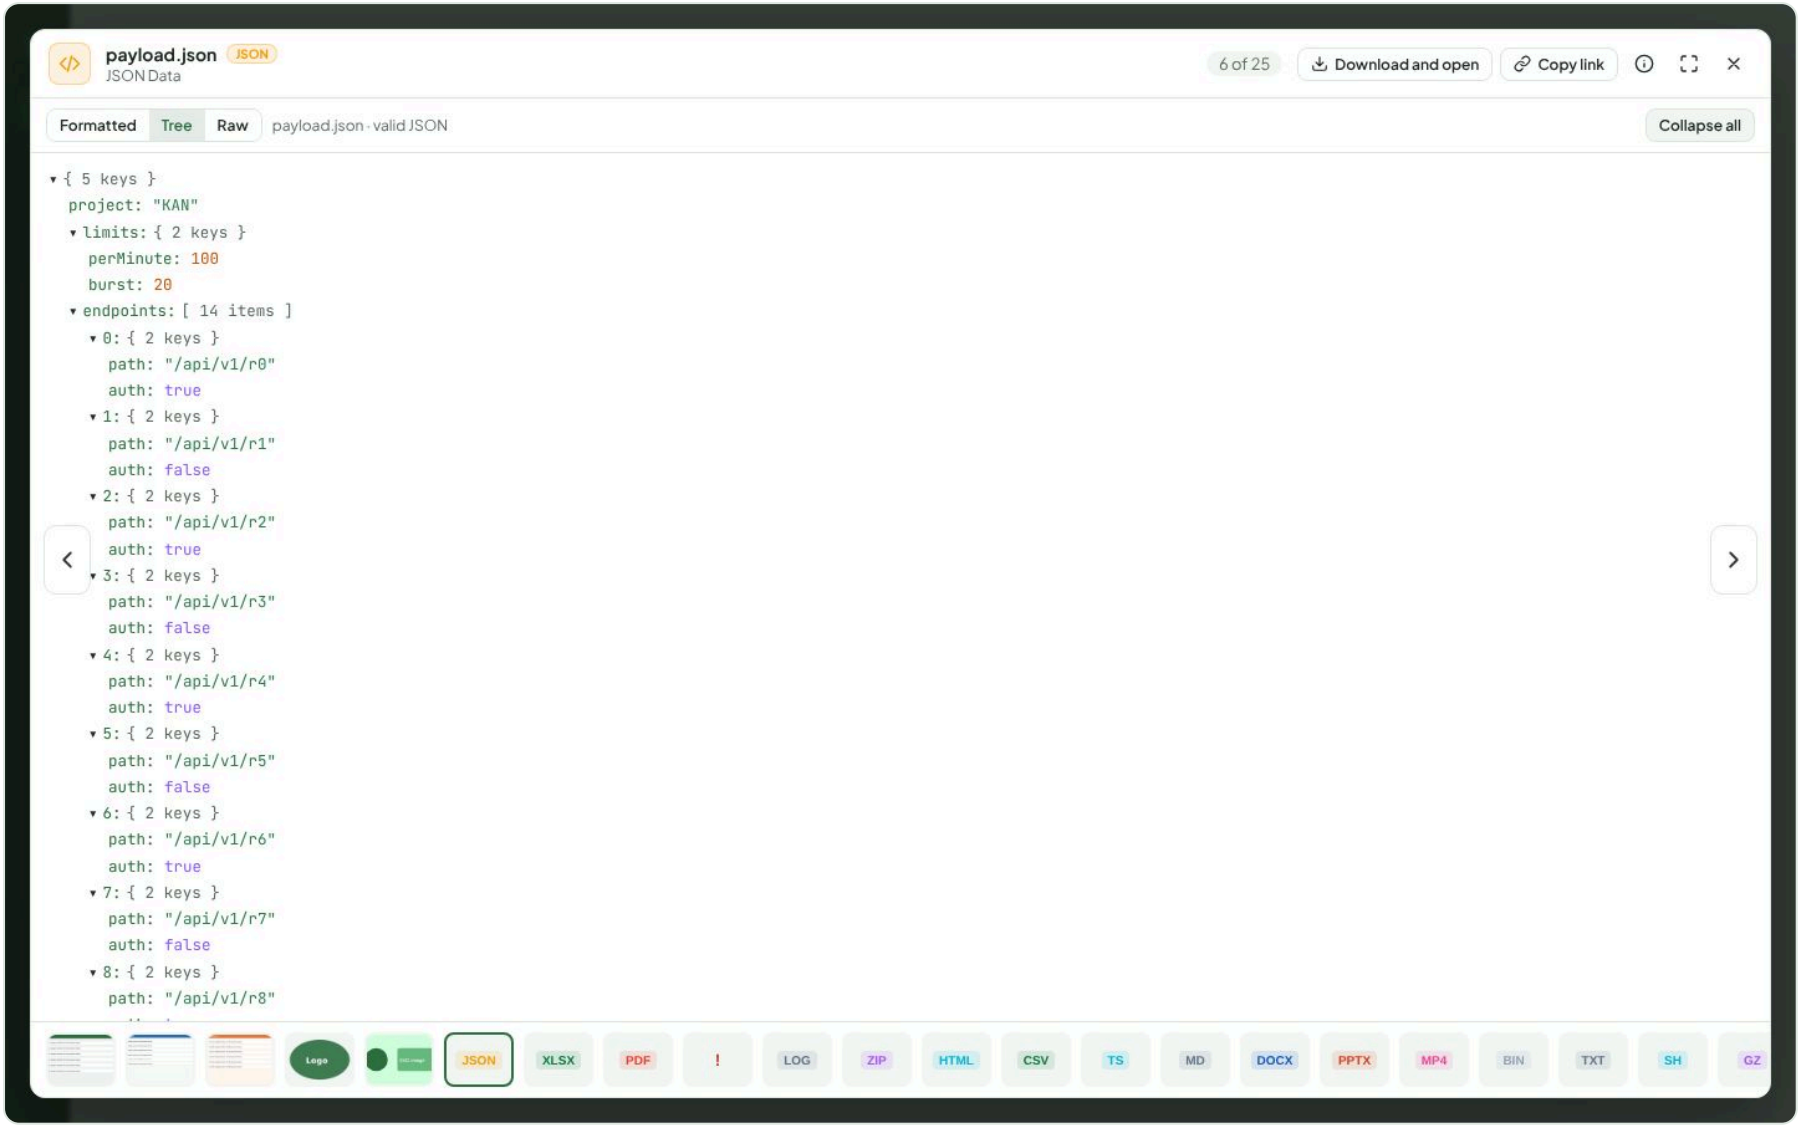

JSON: formatted

Formatted, Tree and Raw views with validity shown.

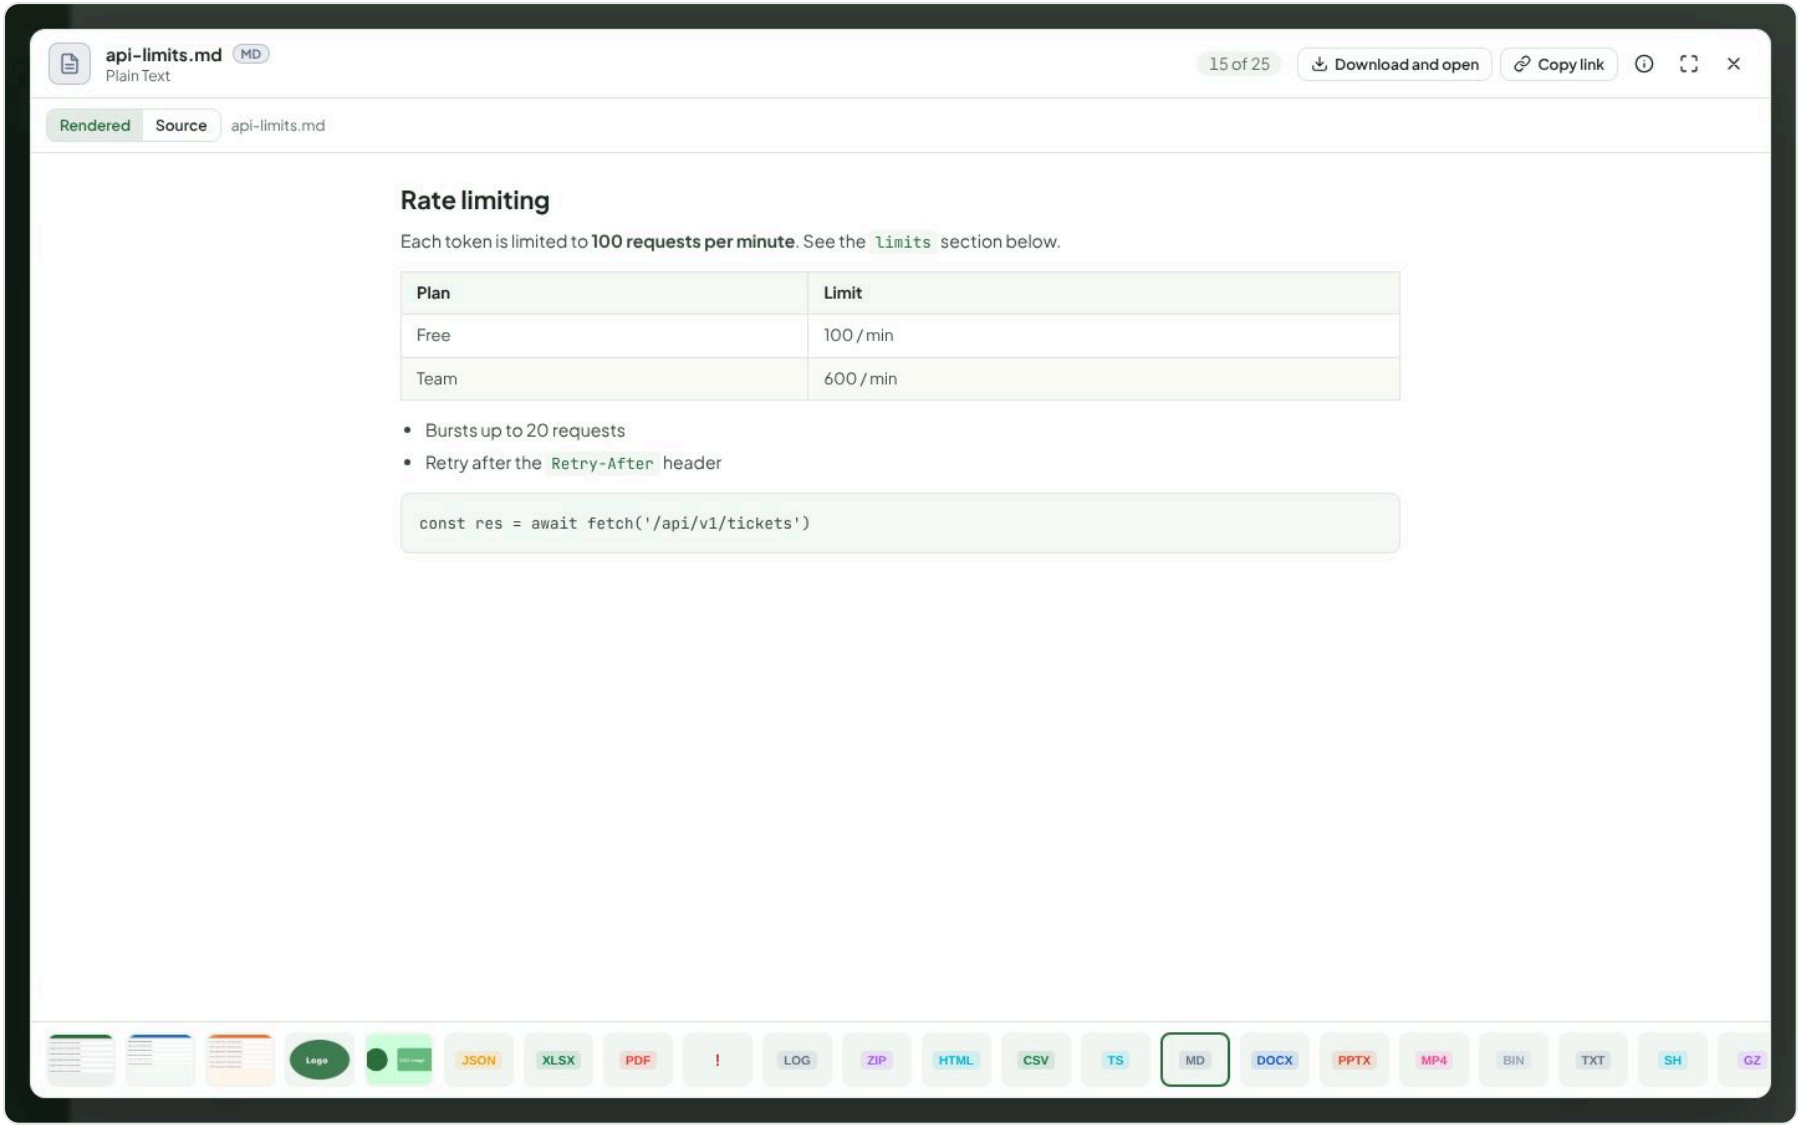

JSON: tree

Expand all / collapse all.

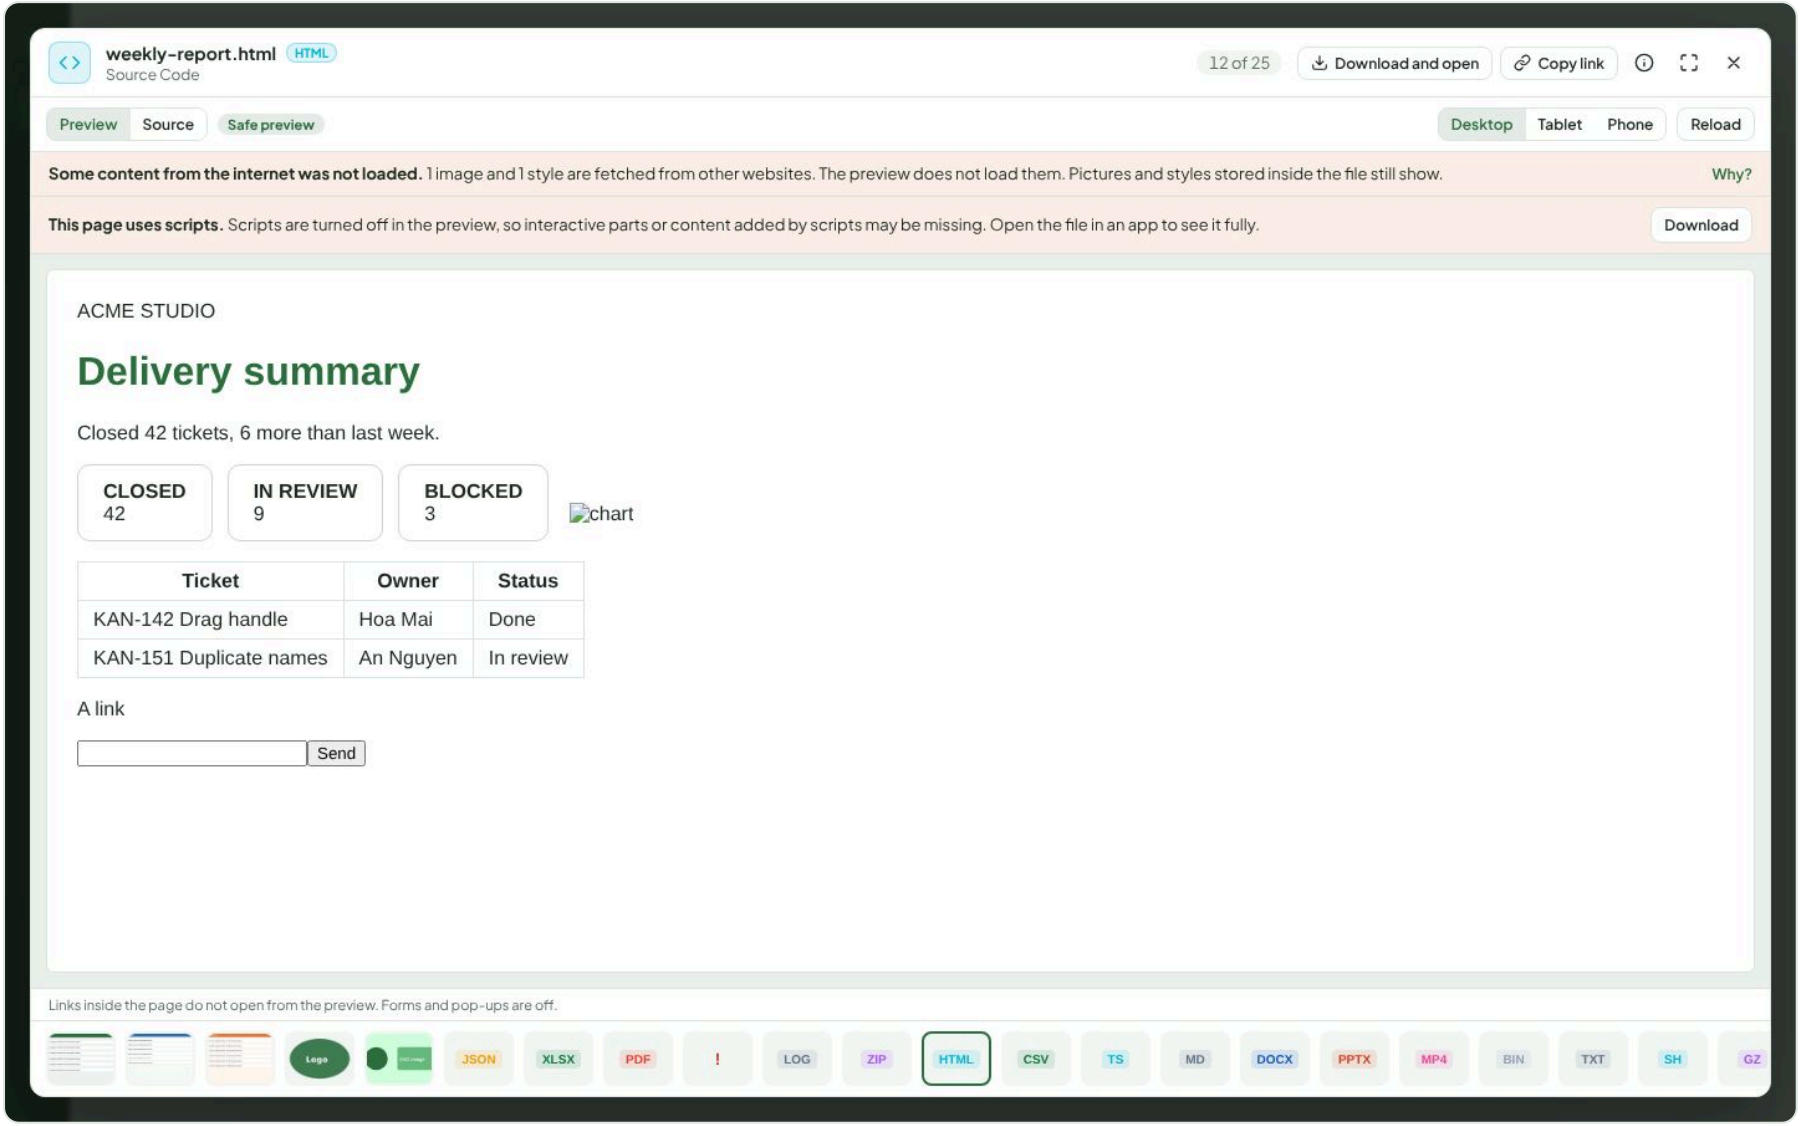

Markdown: rendered like Docs

Tables, lists and code render as in Docs; the Source switch shows the text.

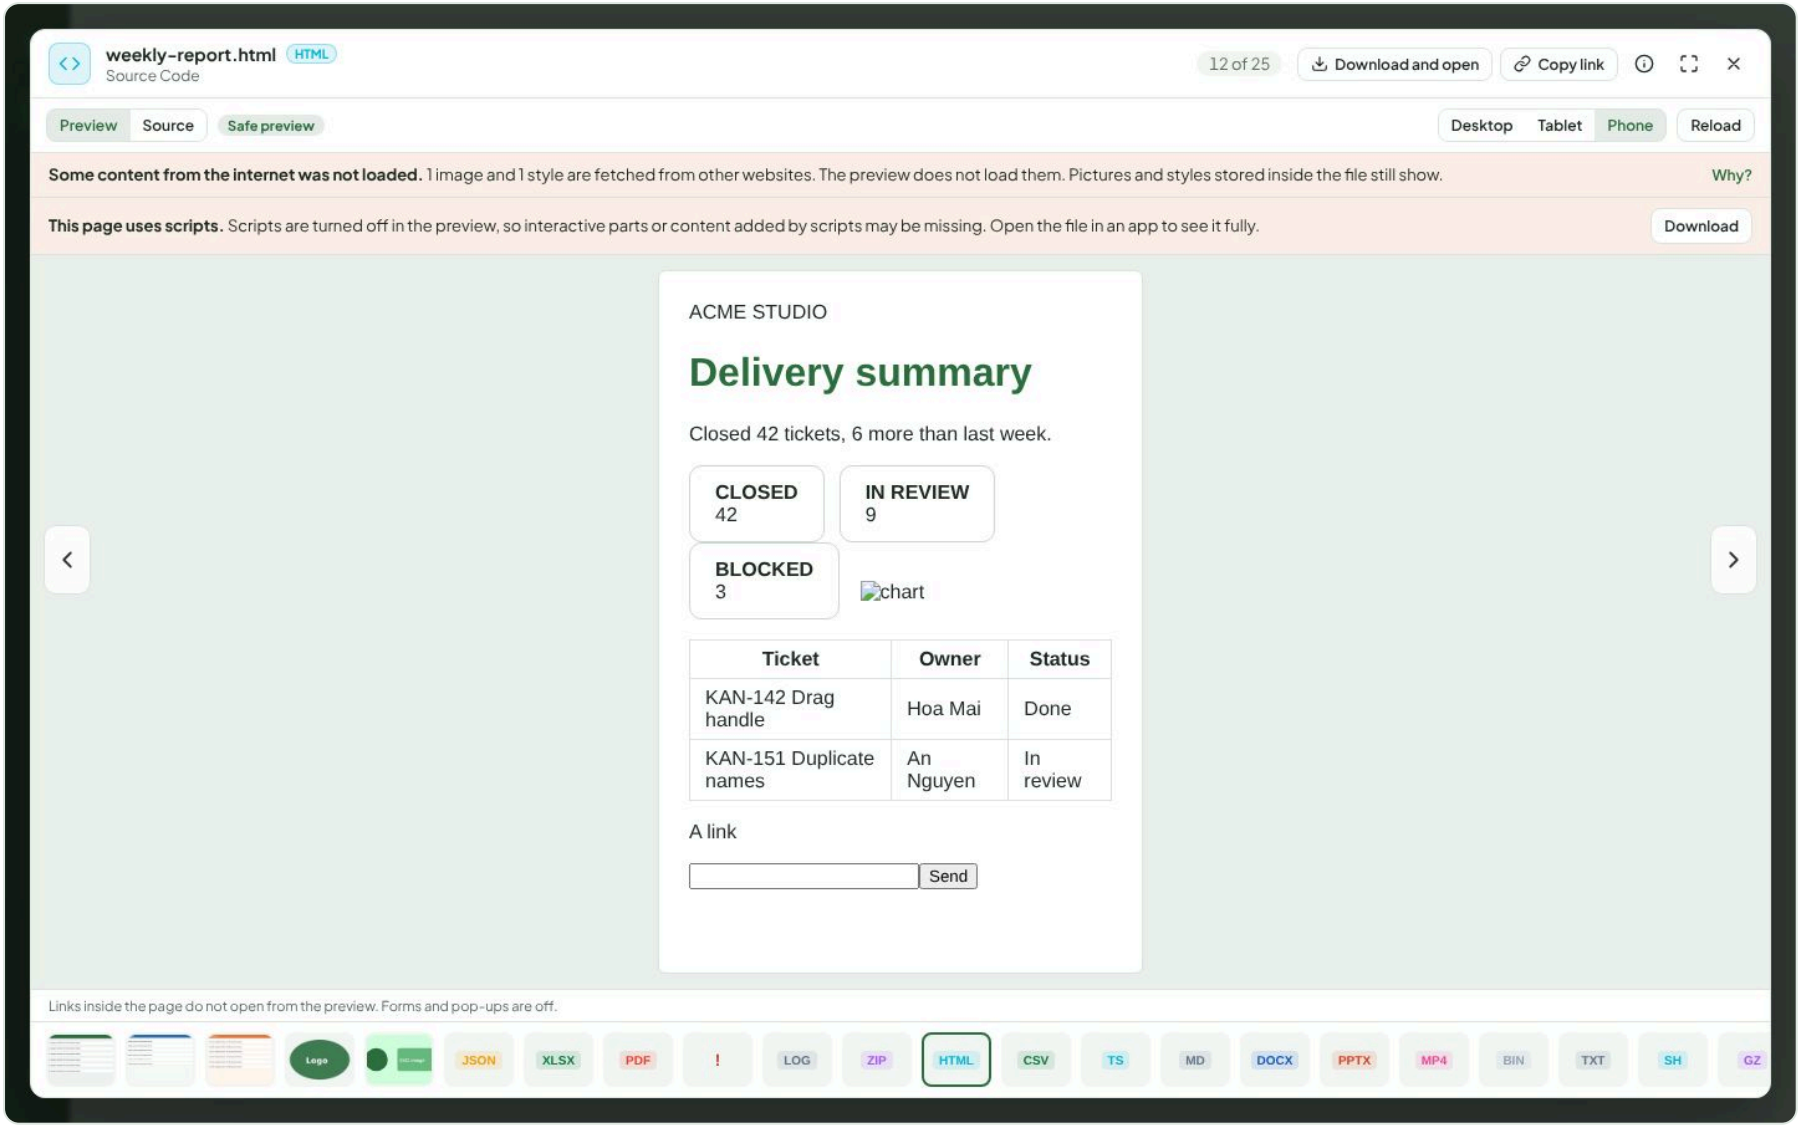

HTML in a locked frame

The page looks right, but its script did not run (the page background stays white), the outside picture and stylesheet were not loaded (no request left the app), and the form and links are off. Notices explain what was blocked.

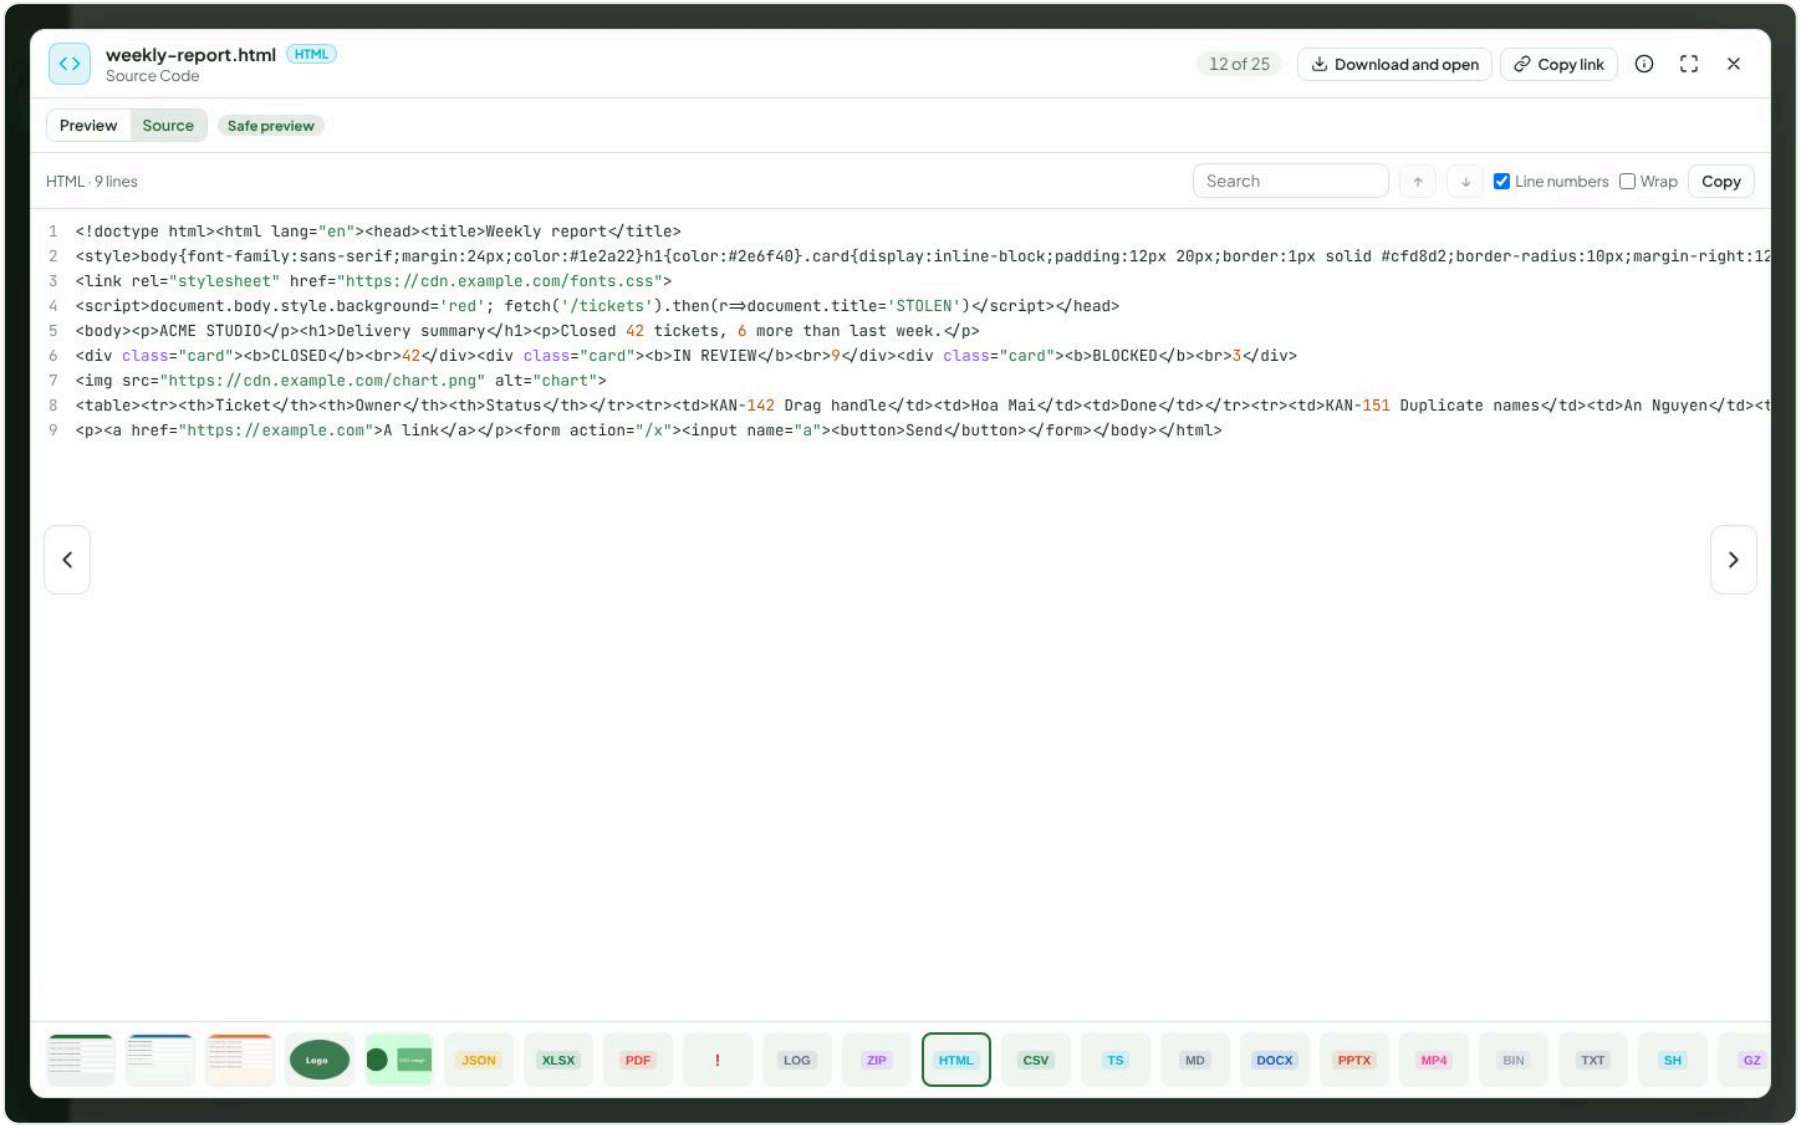

HTML at phone width

Desktop, Tablet and Phone width switch.

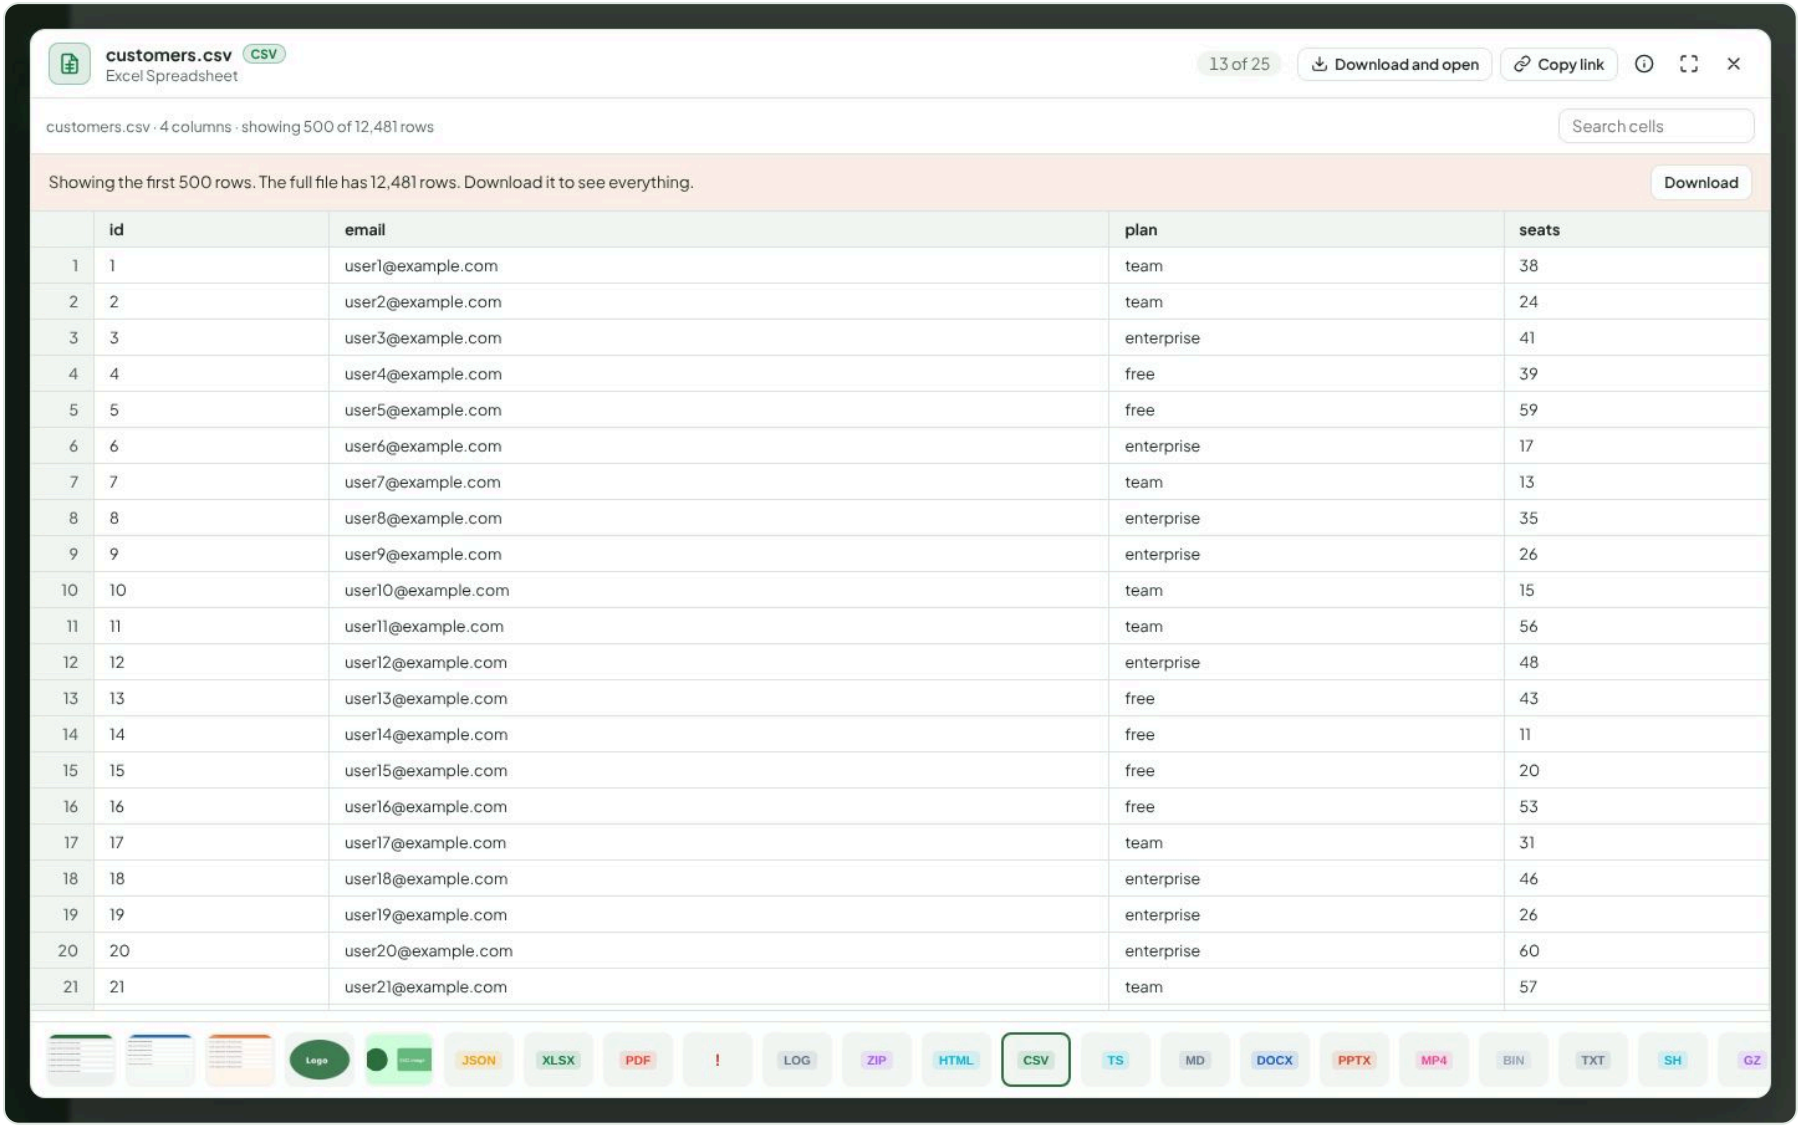

HTML source

The source is one click away and shows the script that did not run.

CSV: first 500 rows

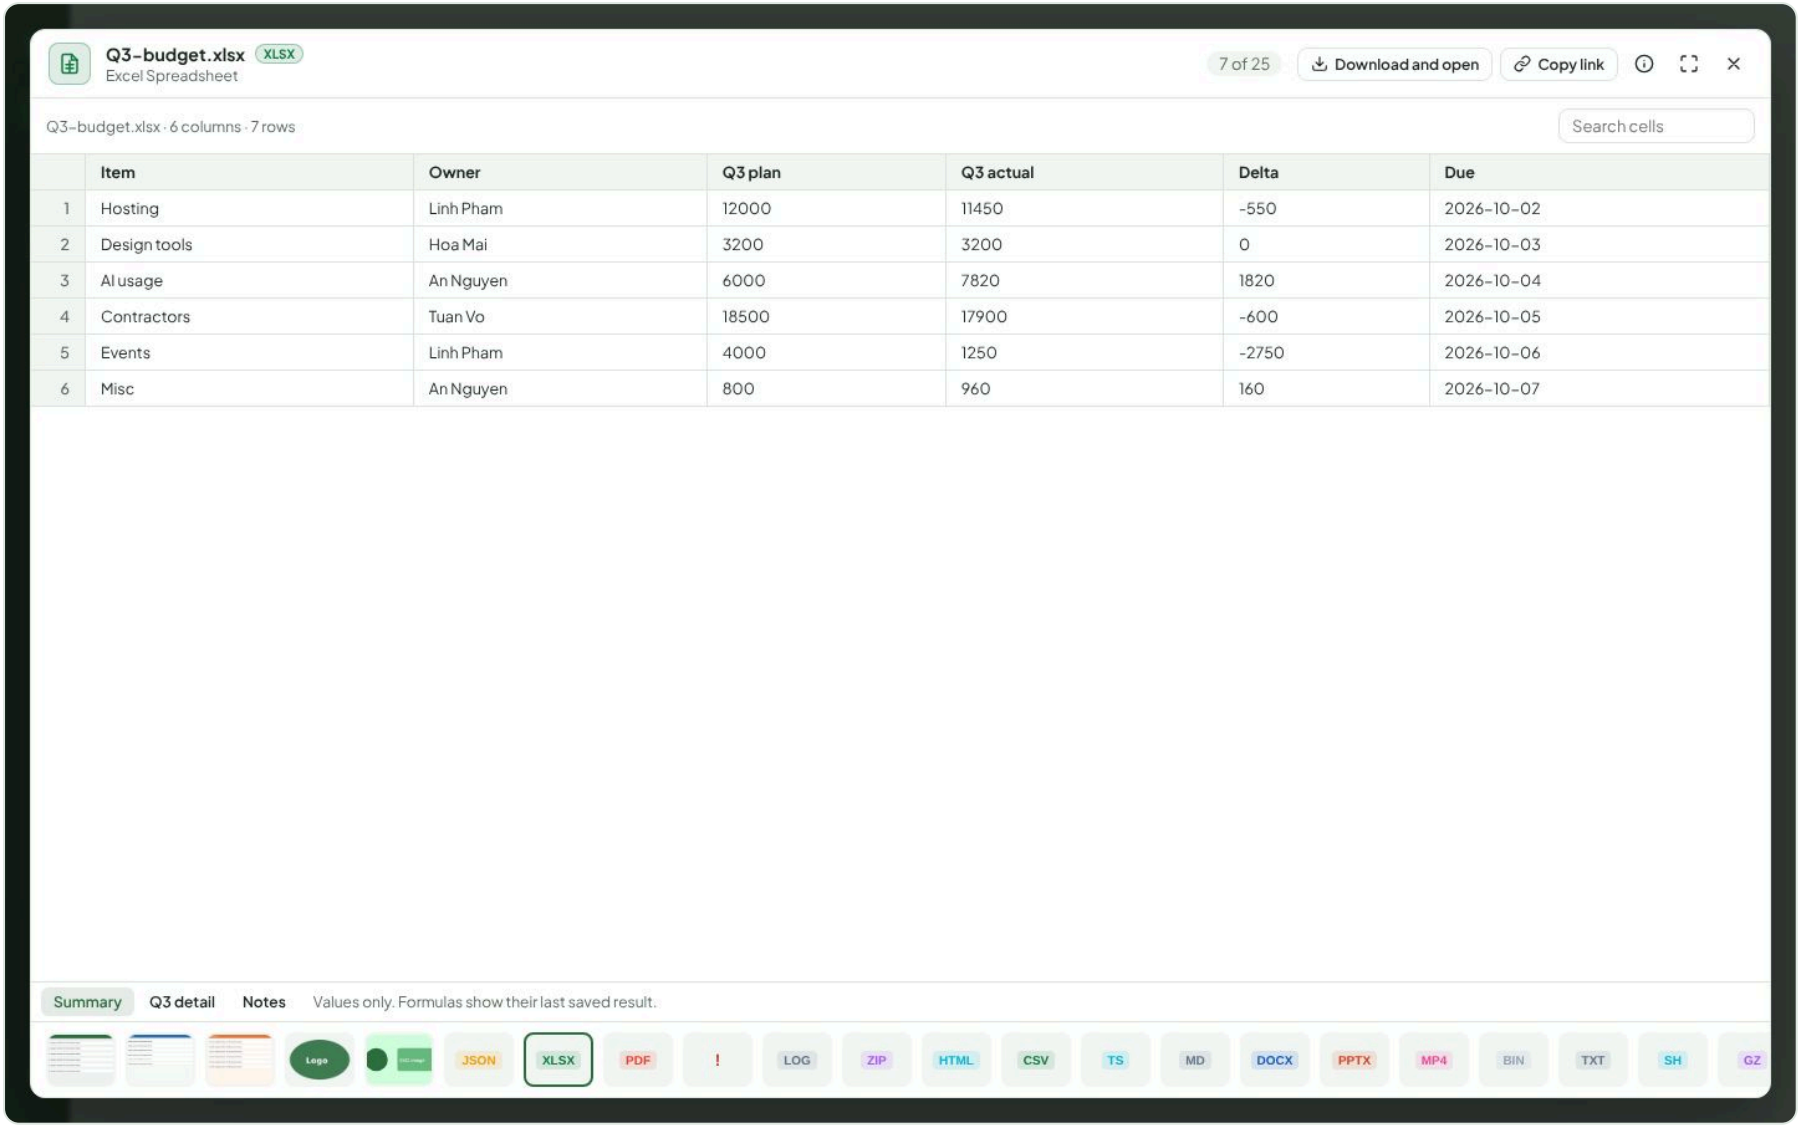

Delimiter detected, frozen header, search, and a note with a way to download the full 12,481 rows.

	id	email	plan	seats
1	1	user1@example.com	team	38
2	2	user2@example.com	team	24
3	3	user3@example.com	enterprise	41
4	4	user4@example.com	free	39
5	5	user5@example.com	free	59
6	6	user6@example.com	enterprise	17
7	7	user7@example.com	team	13
8	8	user8@example.com	enterprise	35
9	9	user9@example.com	enterprise	26
10	10	user10@example.com	team	15
11	11	user11@example.com	team	56
12	12	user12@example.com	enterprise	48
13	13	user13@example.com	free	43
14	14	user14@example.com	free	11
15	15	user15@example.com	free	20
16	16	user16@example.com	free	53
17	17	user17@example.com	team	31
18	18	user18@example.com	enterprise	46
19	19	user19@example.com	enterprise	26
20	20	user20@example.com	enterprise	60
21	21	user21@example.com	team	57

Excel: a table per sheet

Sheets as tabs, dates shown as dates, values only (no formulas are run).

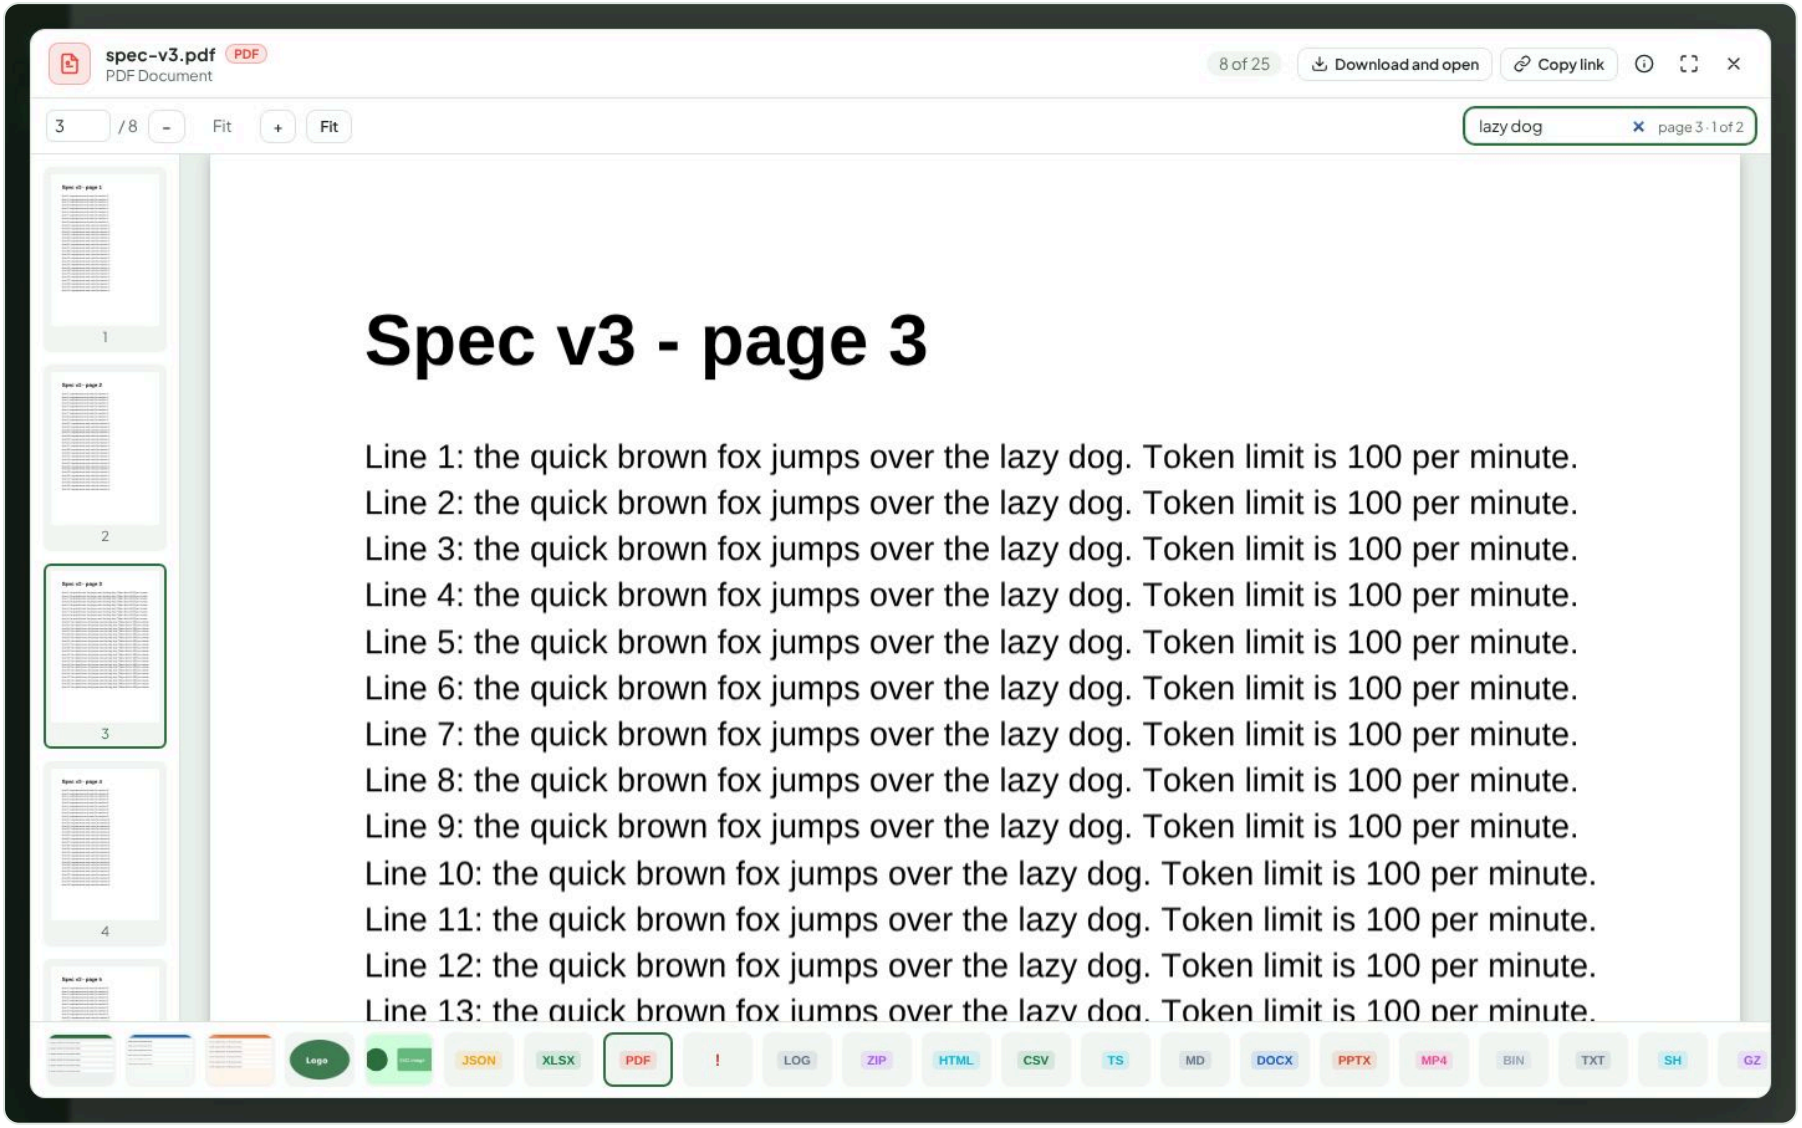

Excel: second sheet

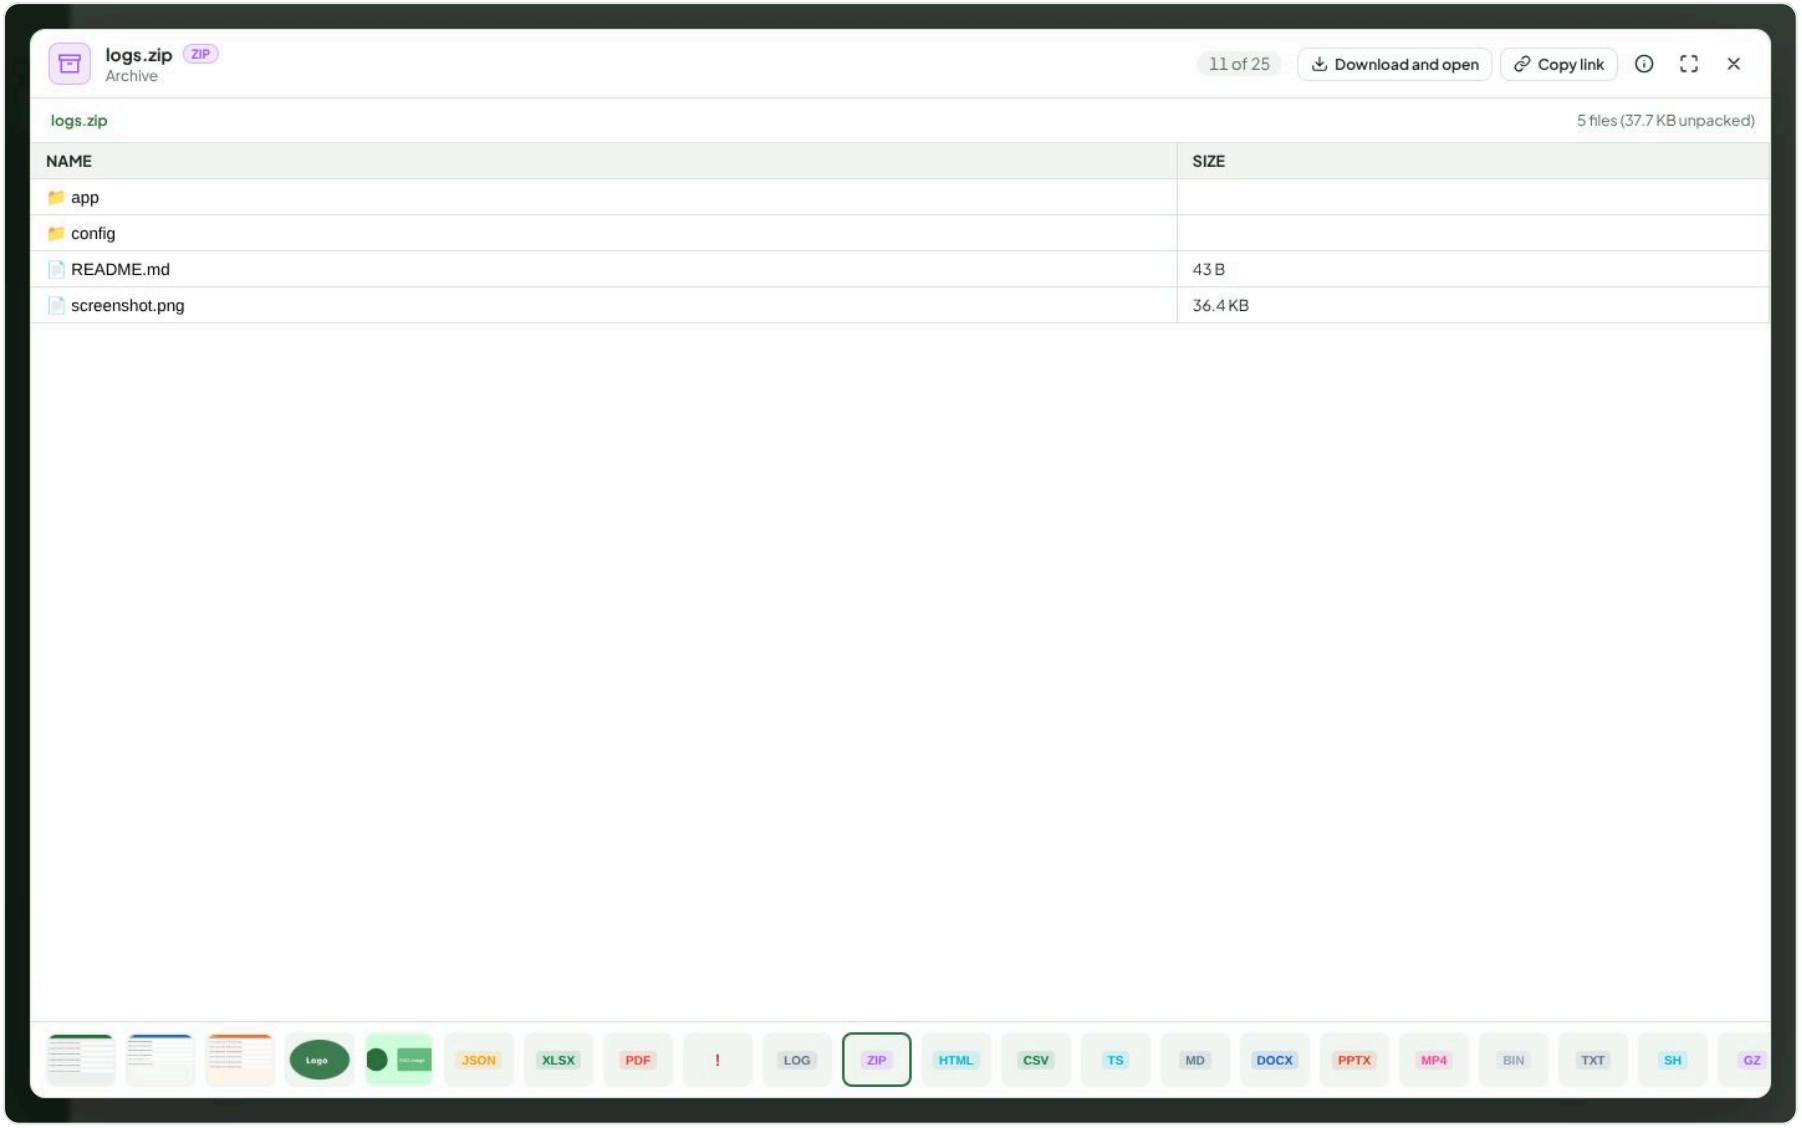

PDF reader with search

Page thumbnails, zoom, page jump and search in the app instead of the browser frame. Searching "lazy dog" jumps to page 3.

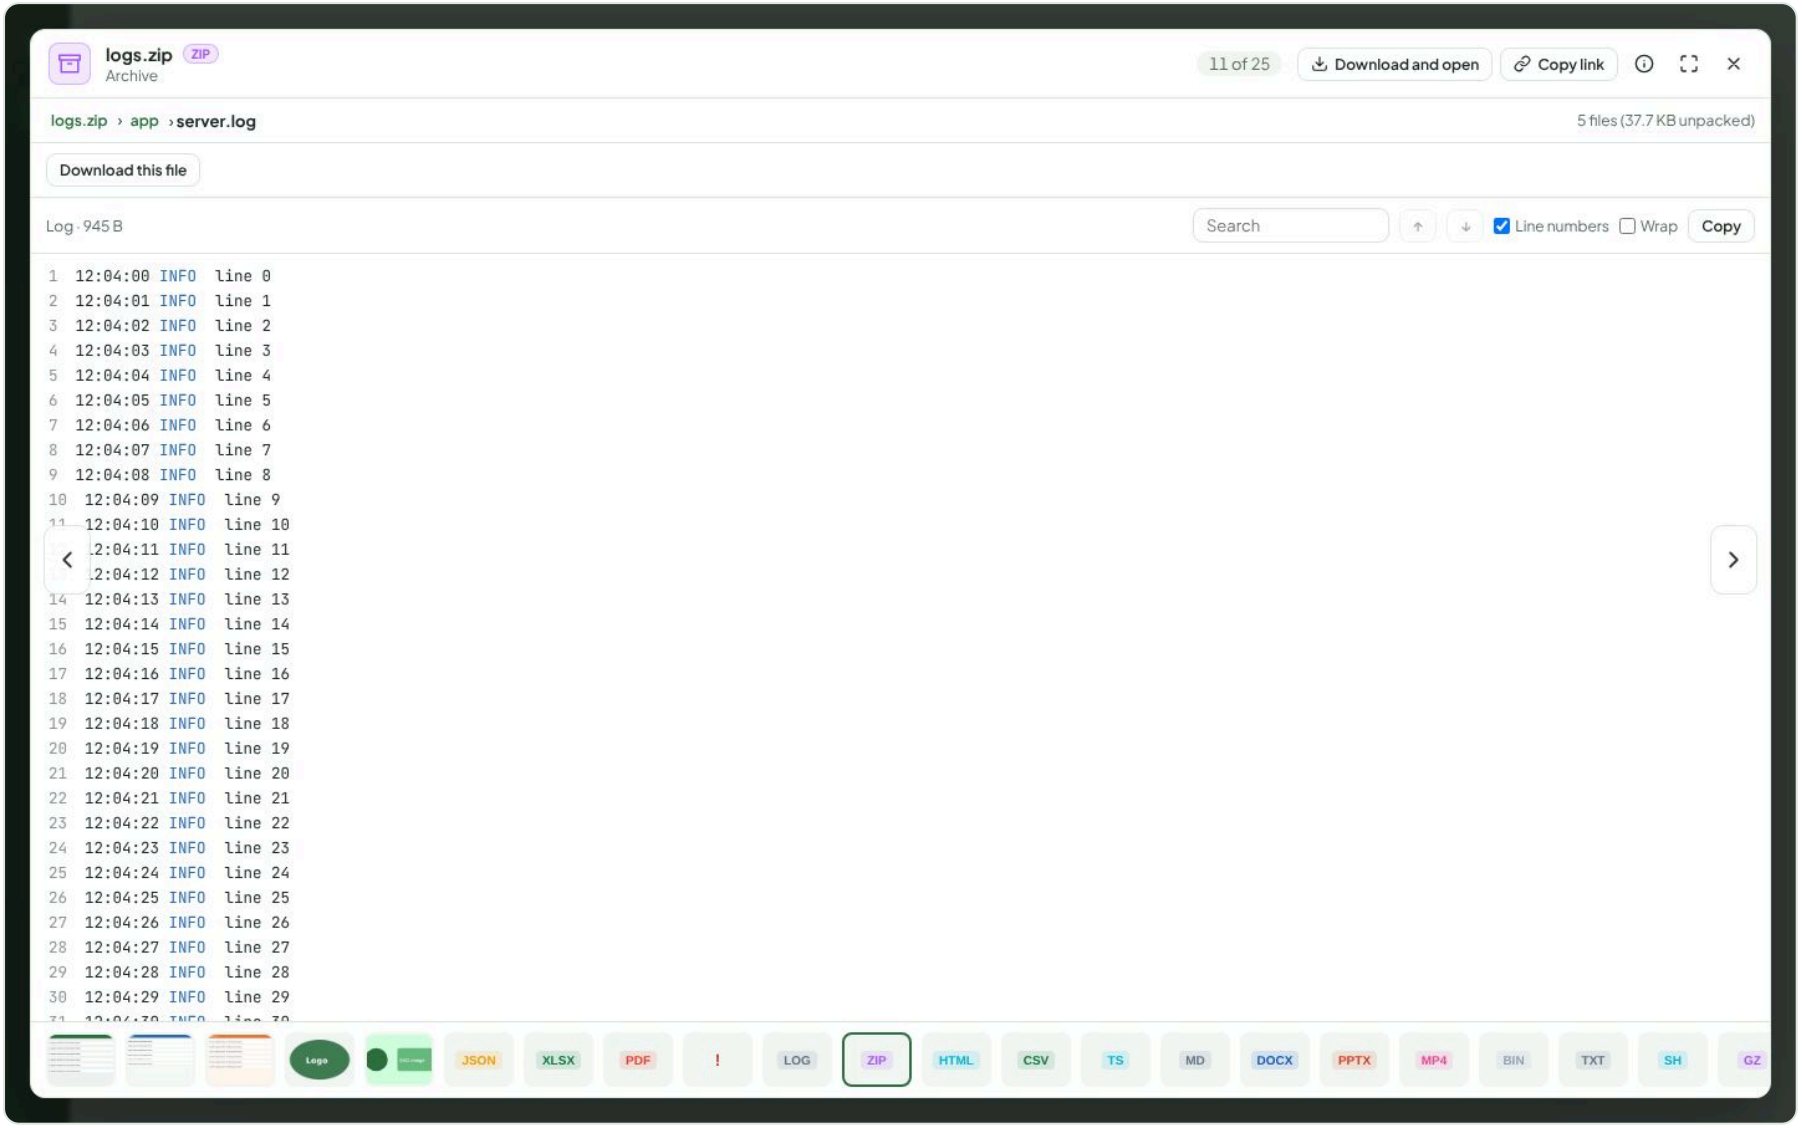

Archive: browse the contents

zip, tar and gz open as a file list with folders. Nothing is unpacked to disk and nothing is run.

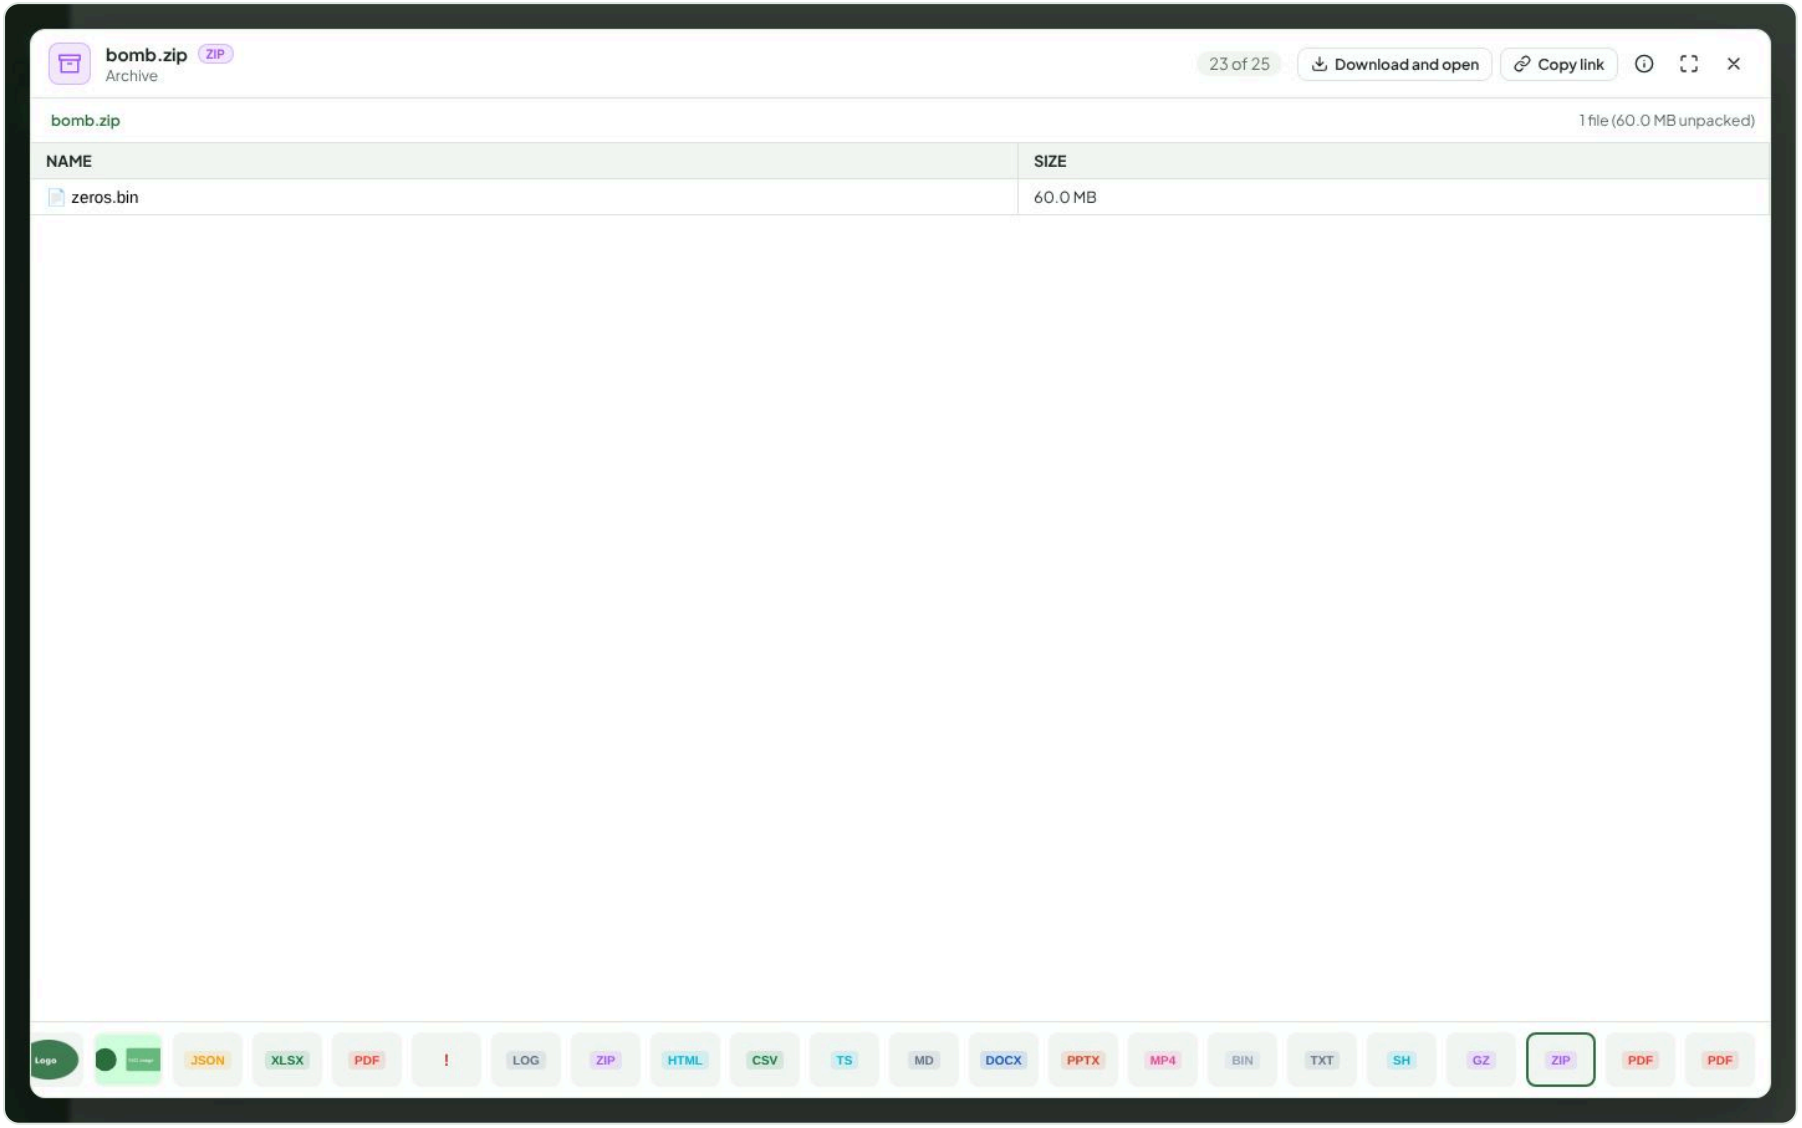

Archive: a file inside

Click a file to read it right there; the breadcrumb goes back.

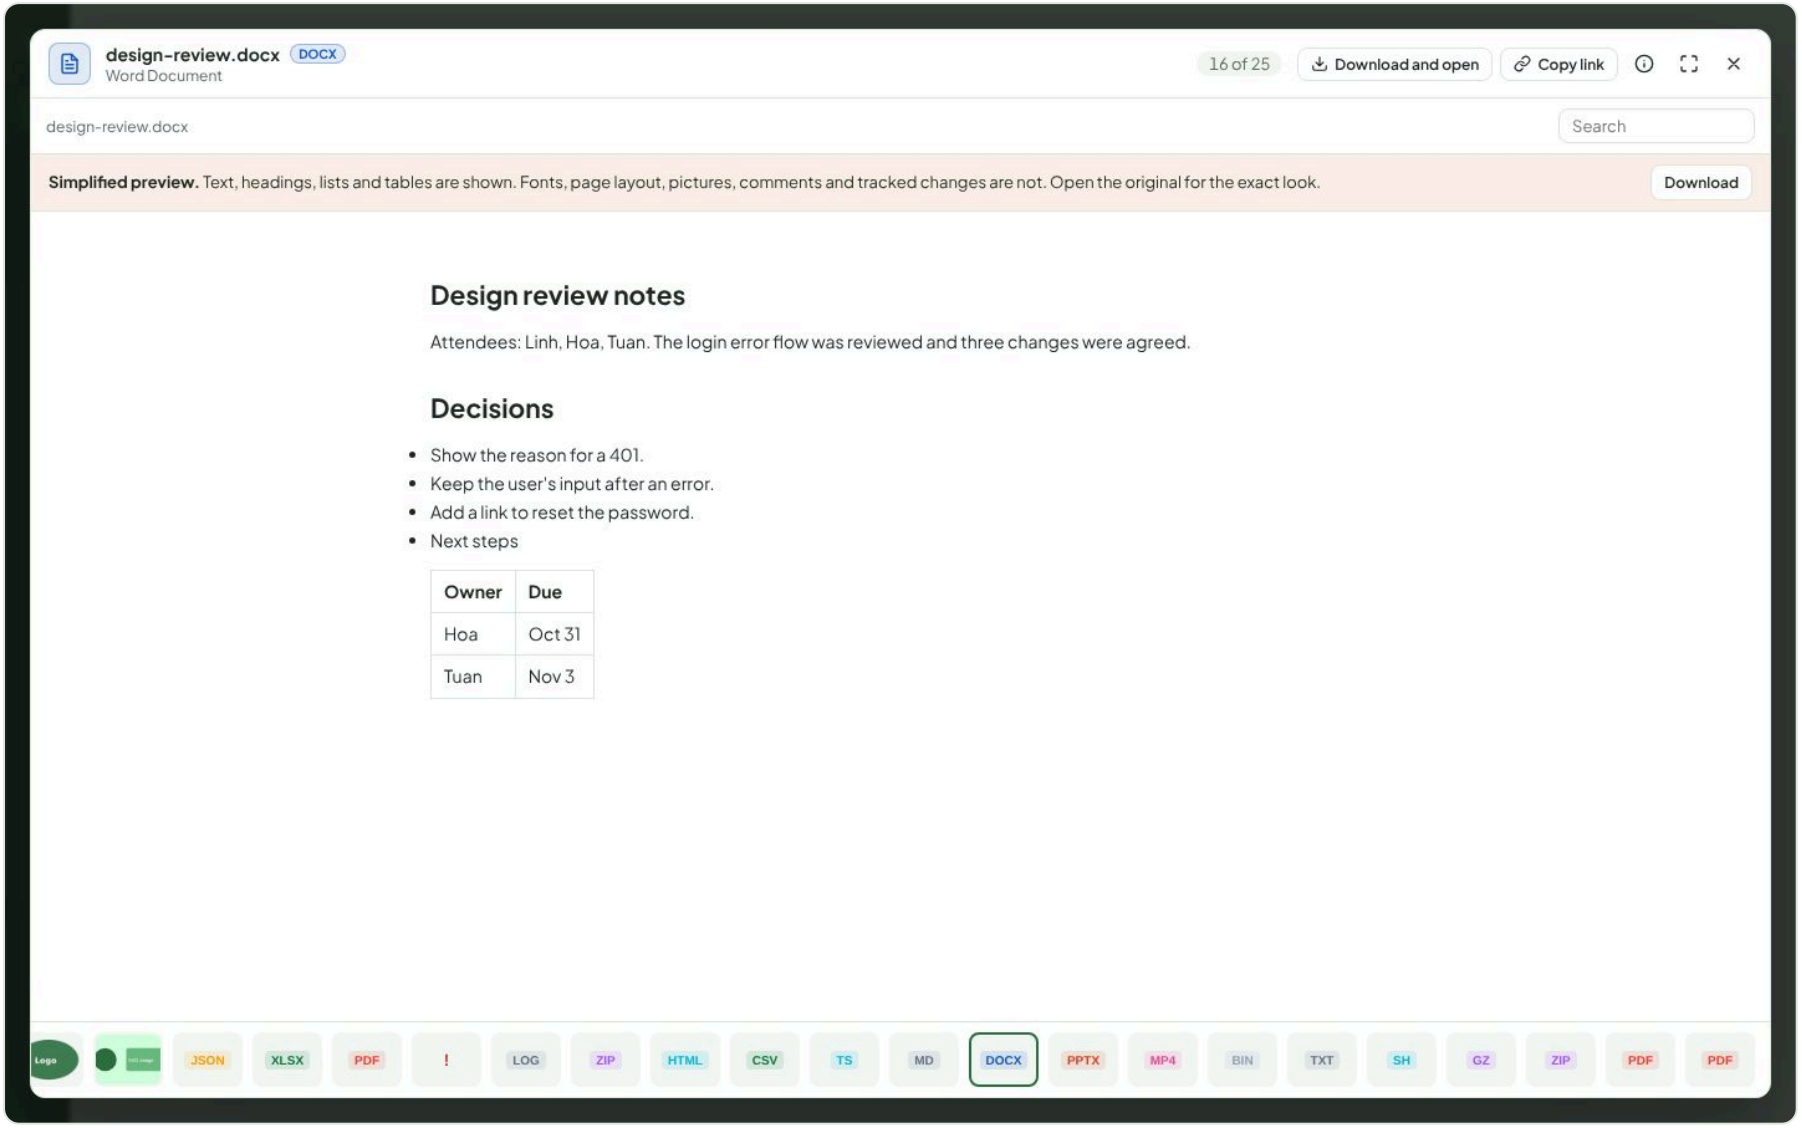

Archive caps

A 60 MB entry (a zip bomb stand-in) is listed with its size but not opened: entries over 5 MB are never unpacked, and listings are capped at 2,000 entries.

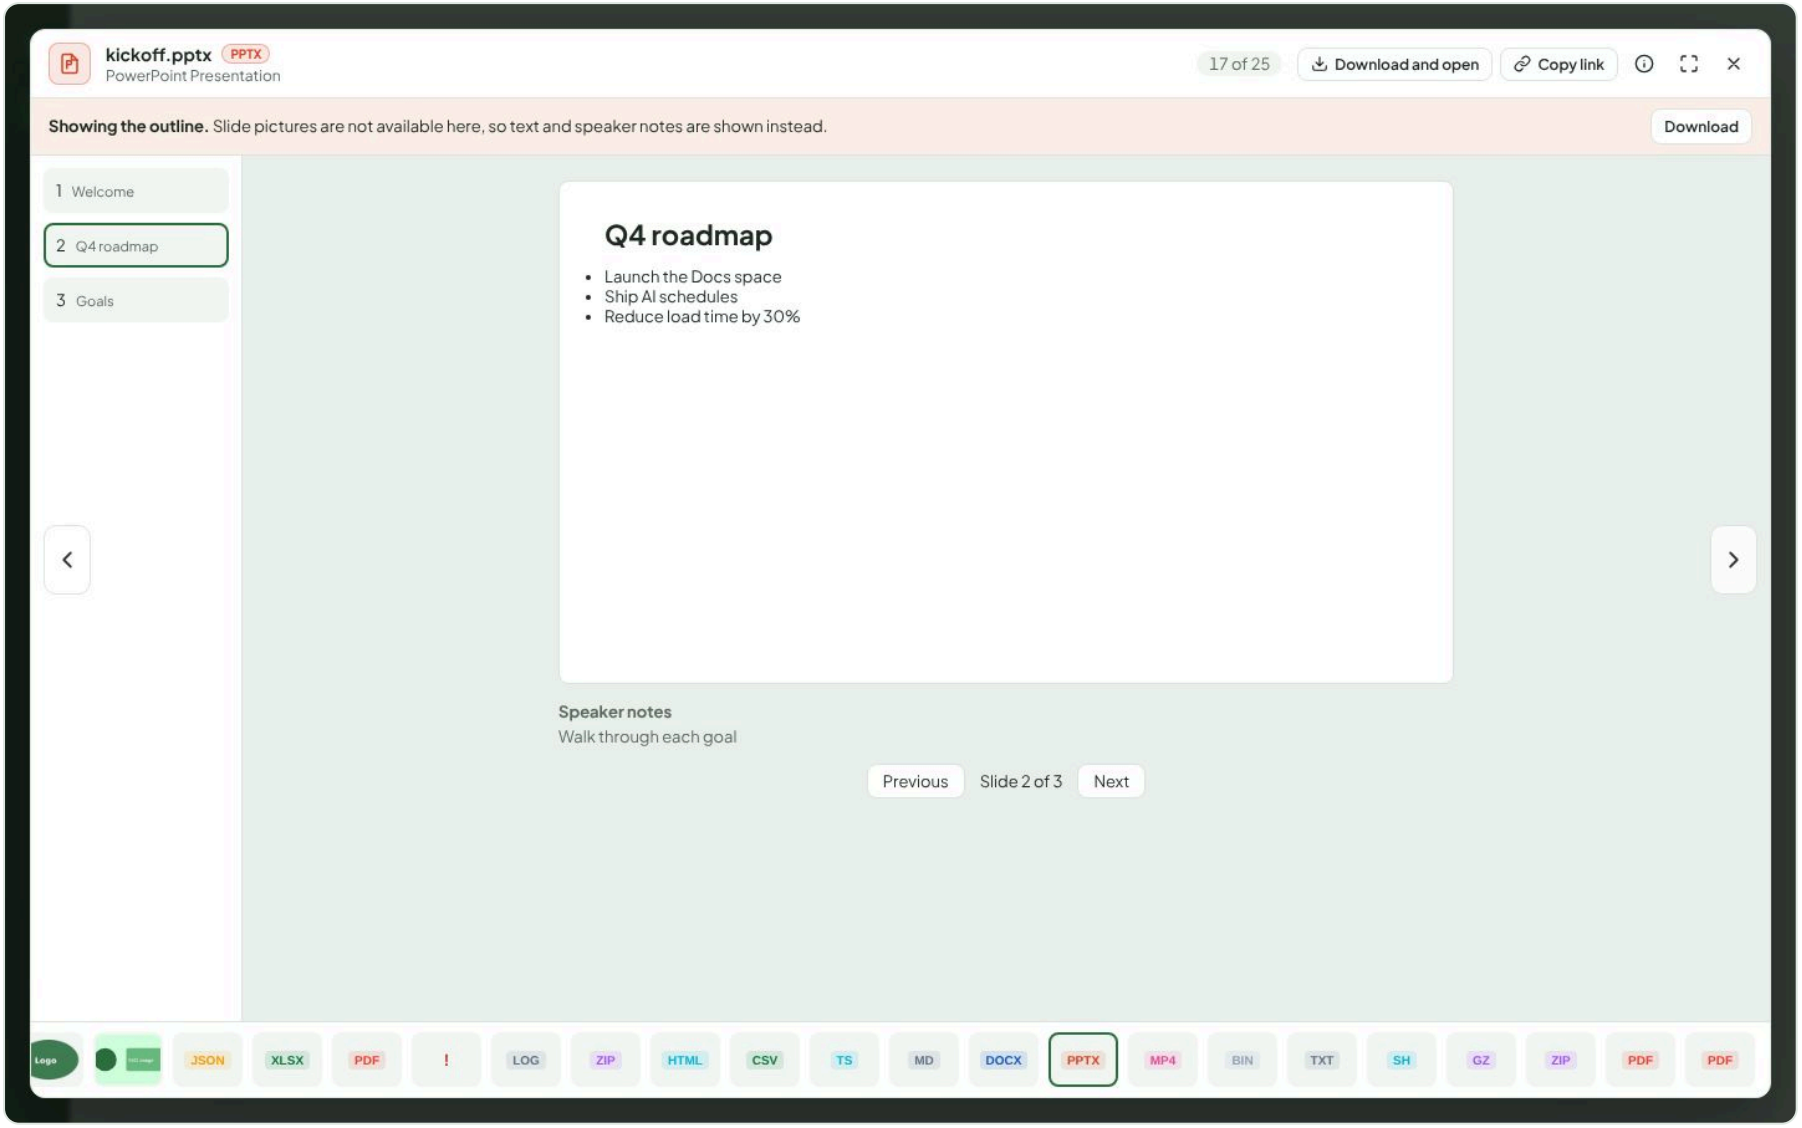

Word: simplified reading view

Headings, lists and tables, read in the browser without a converter; a note says what is left out.

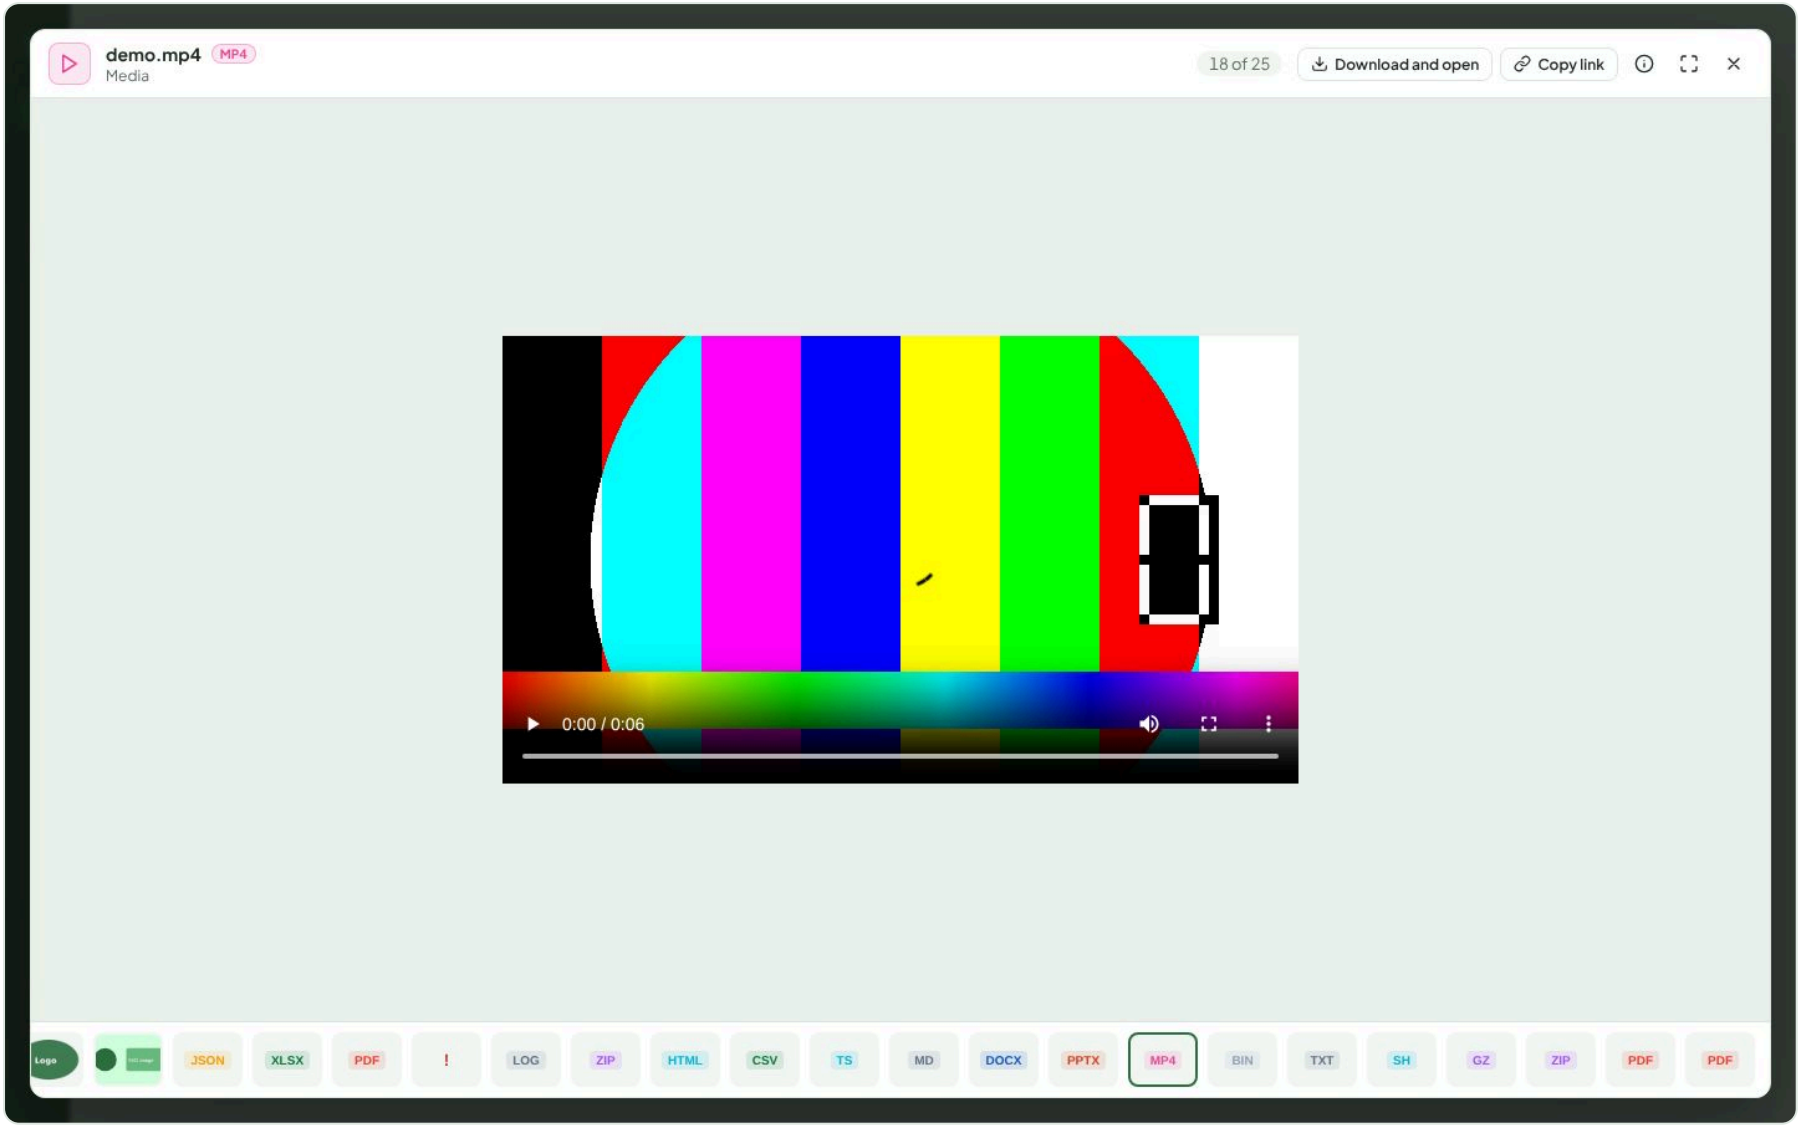

PowerPoint: outline with speaker notes

Slides as text with notes; slide pictures would need a converter and are left for later.

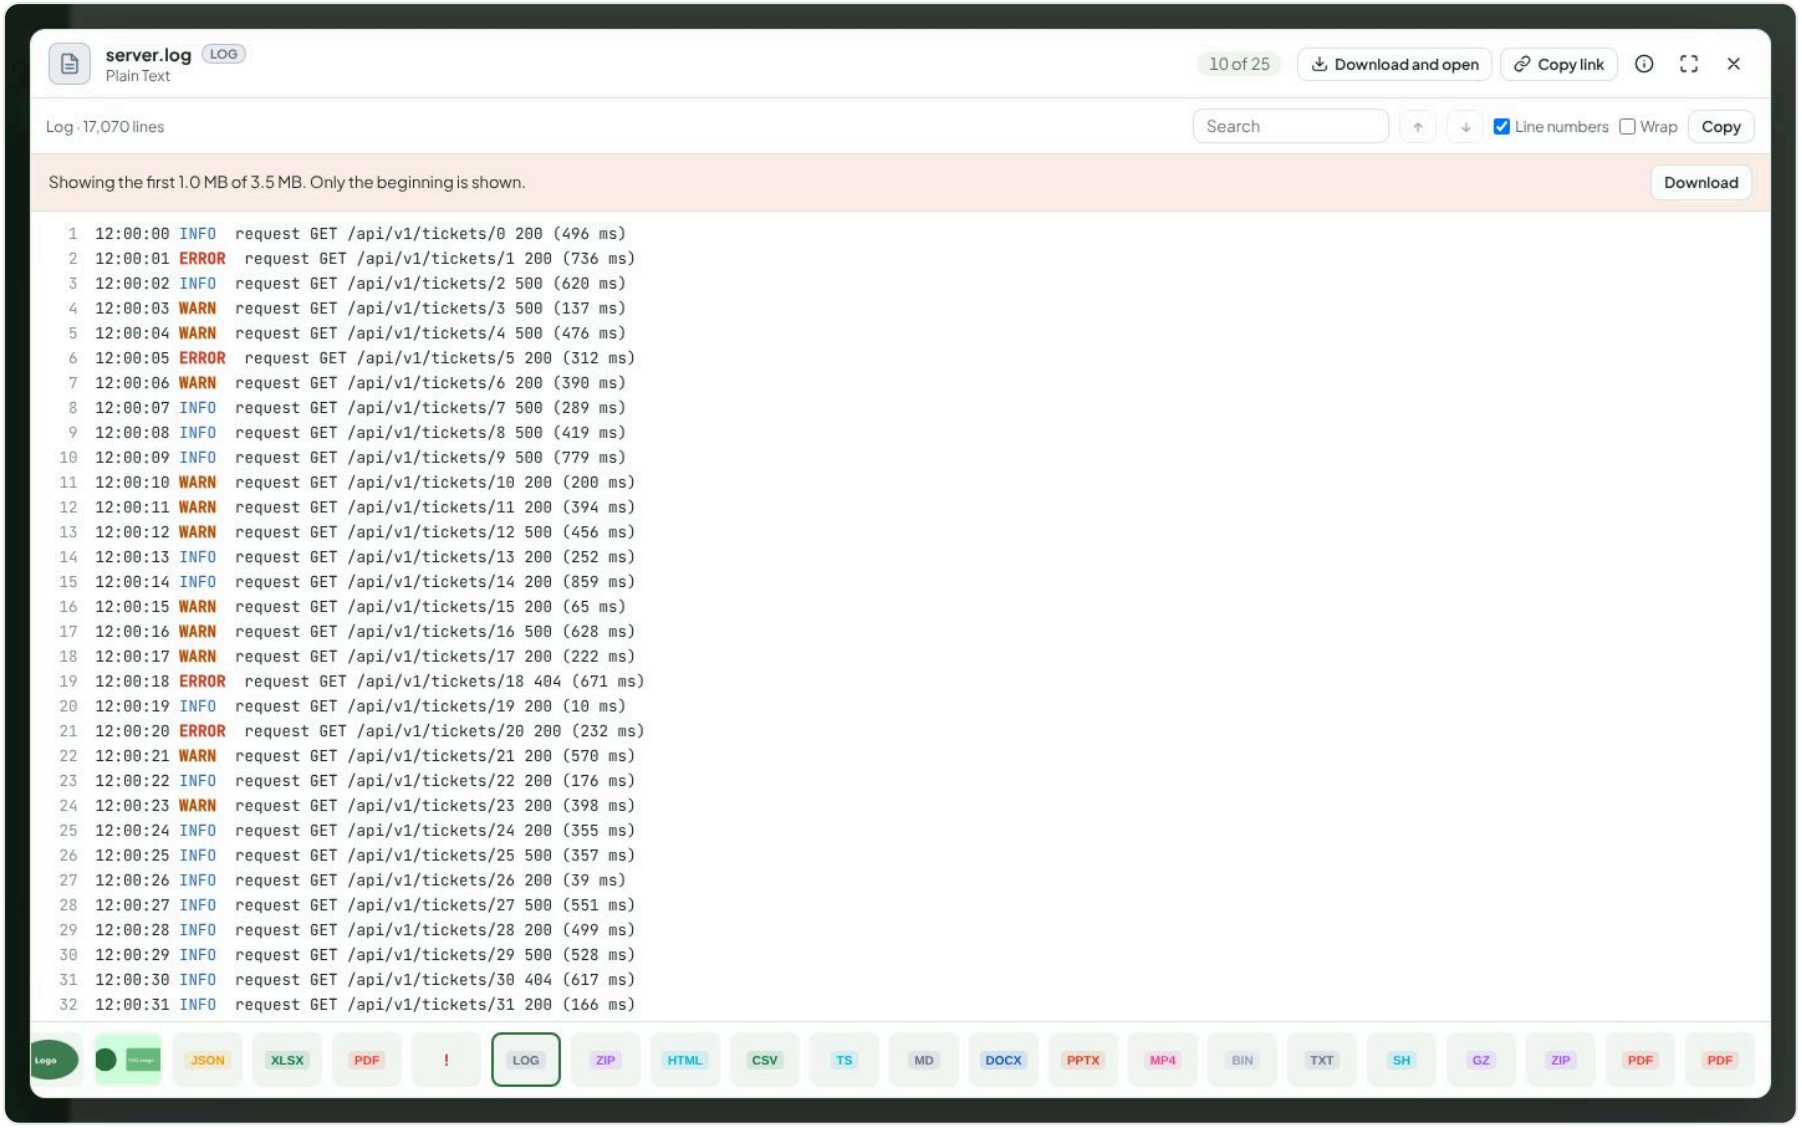

Audio and video

The normal player.

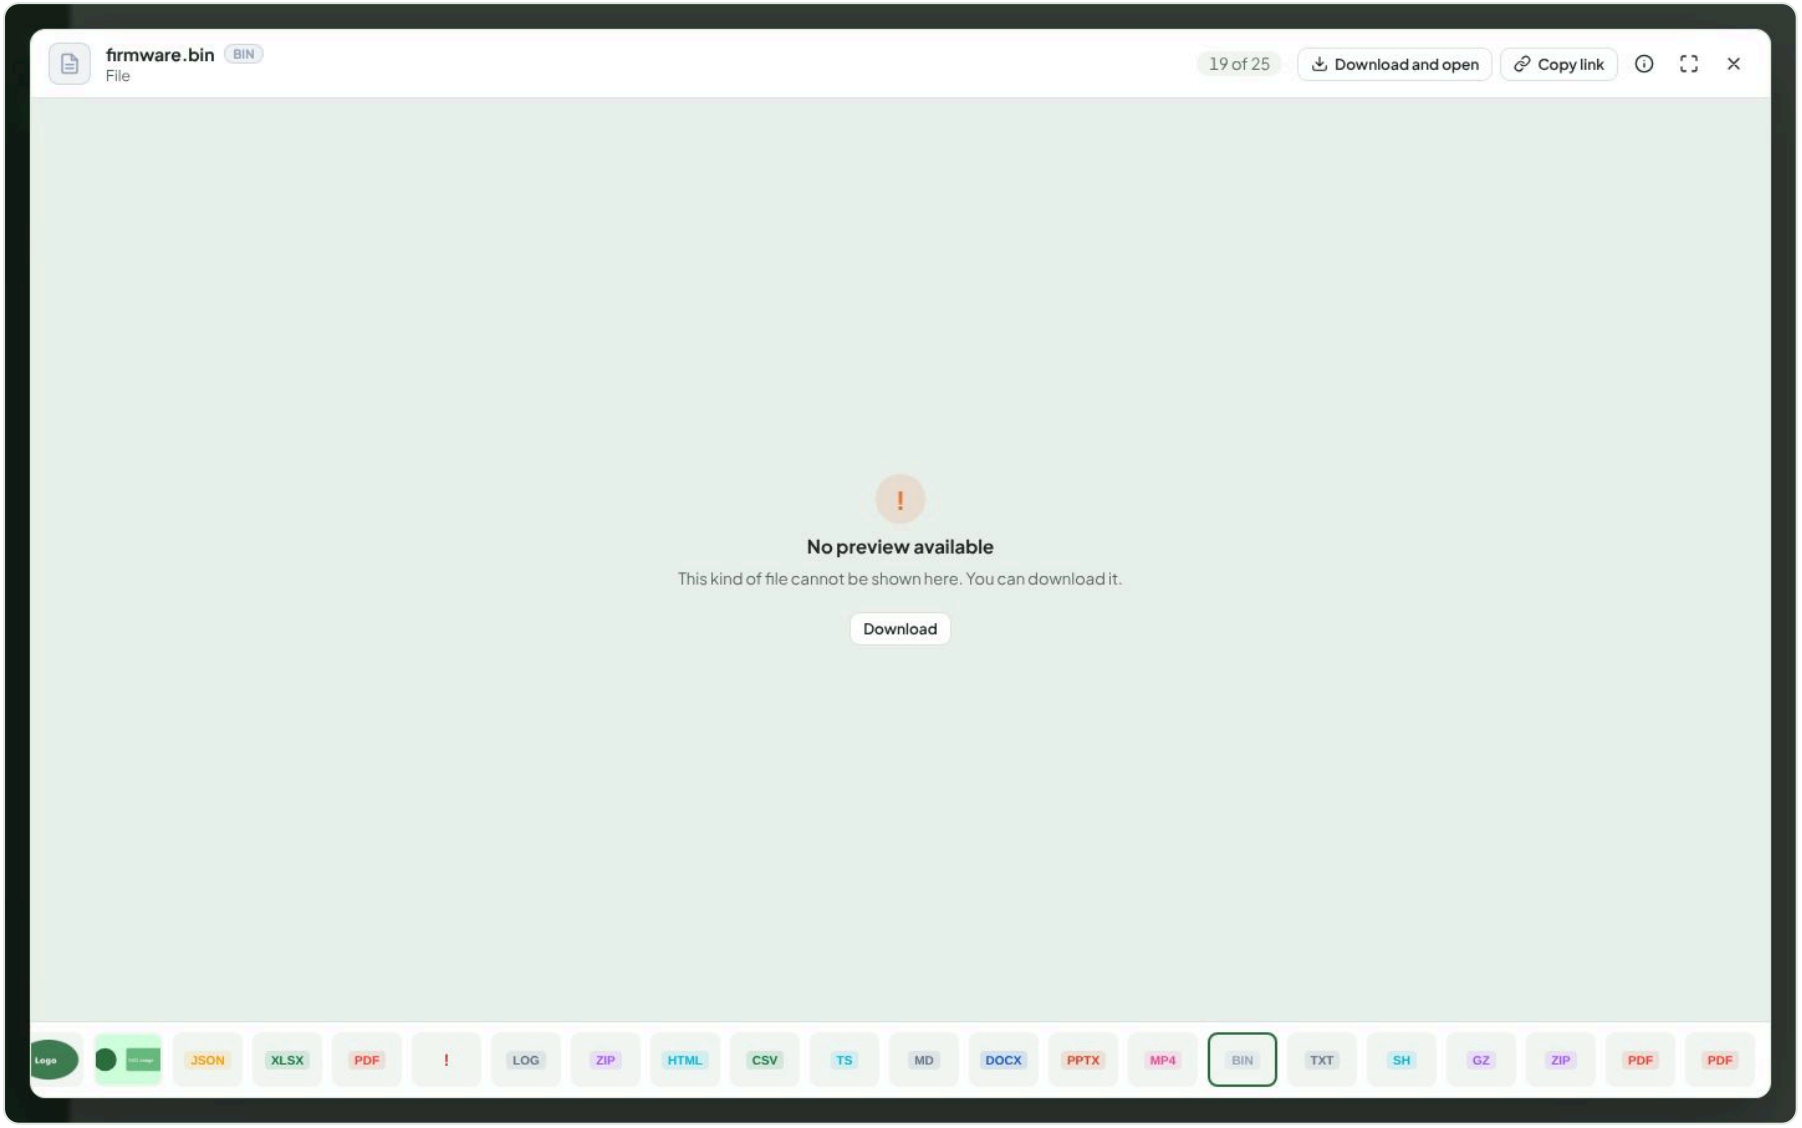

Too large: the first part

A 3.5 MB log shows the first 1 MB with a note and Download.

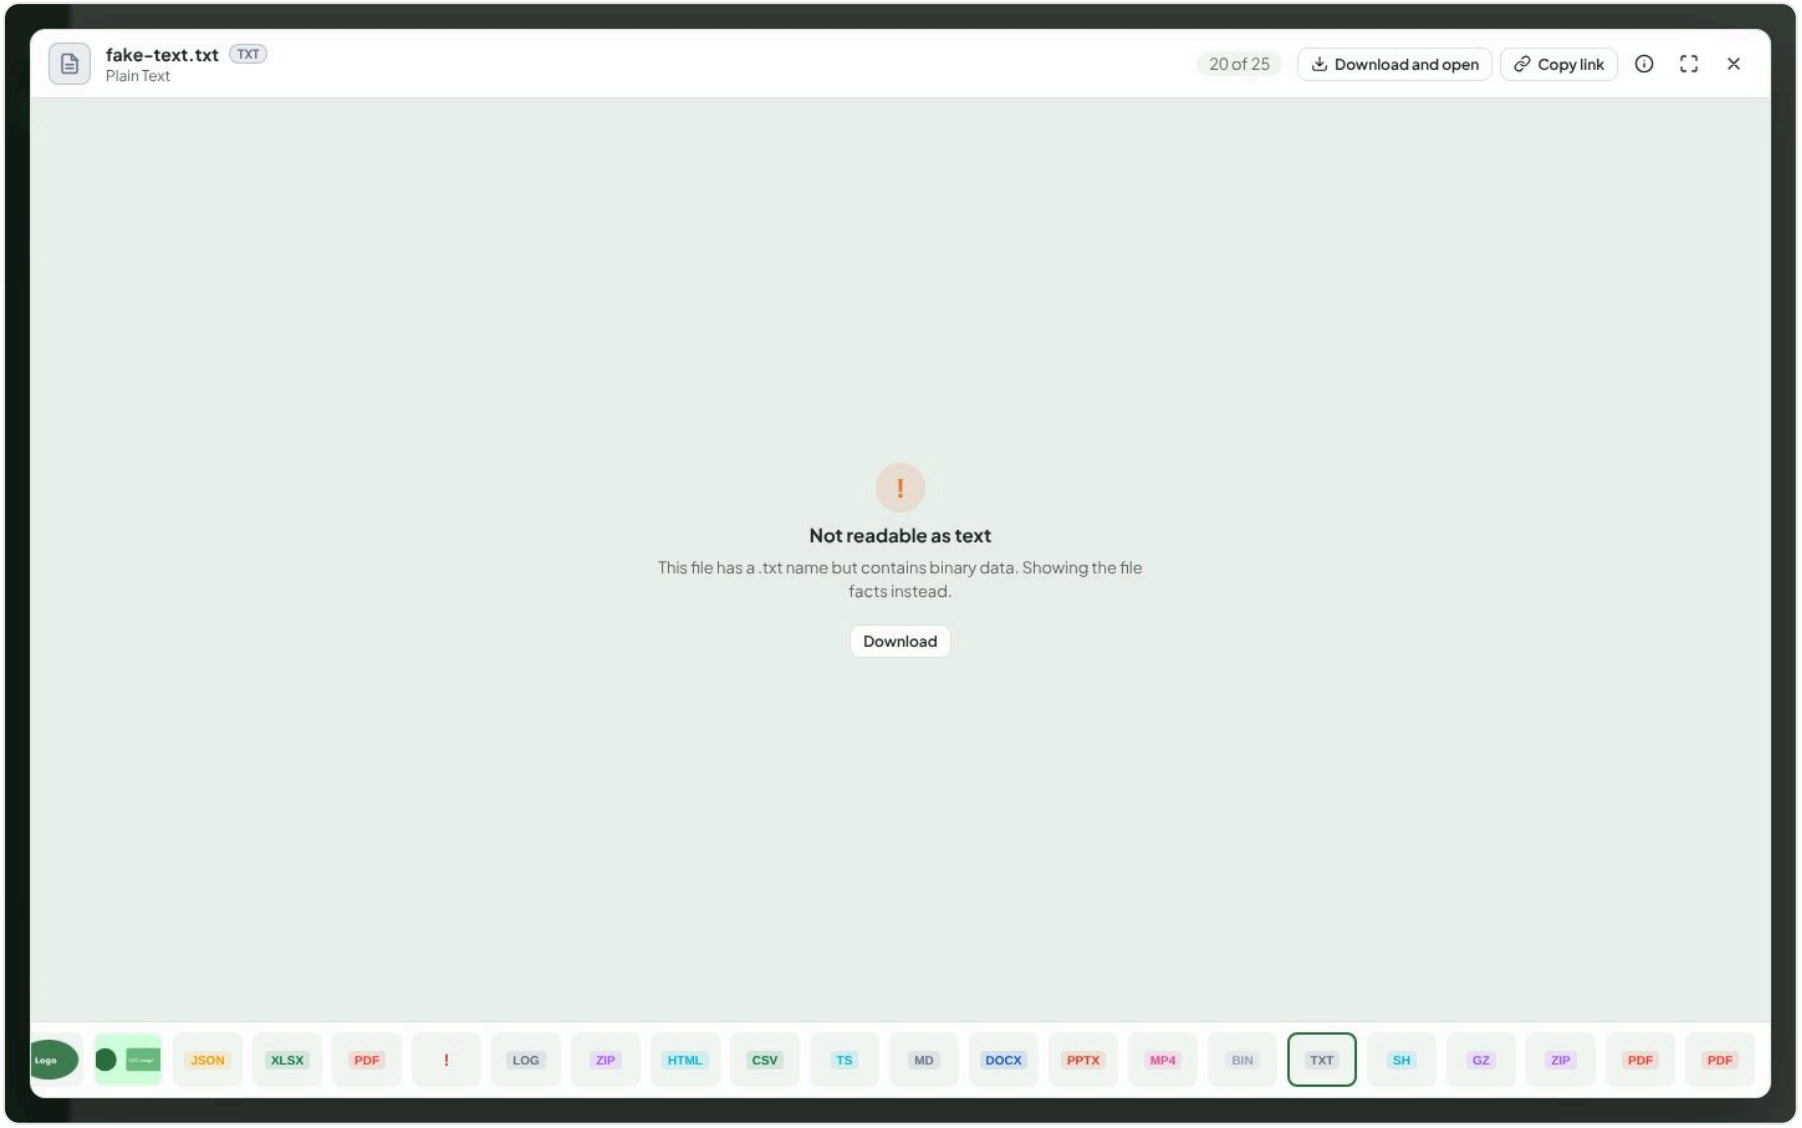

Files with no reader

A card with a clear message and Download (and Open in app on desktop), never a blank window.

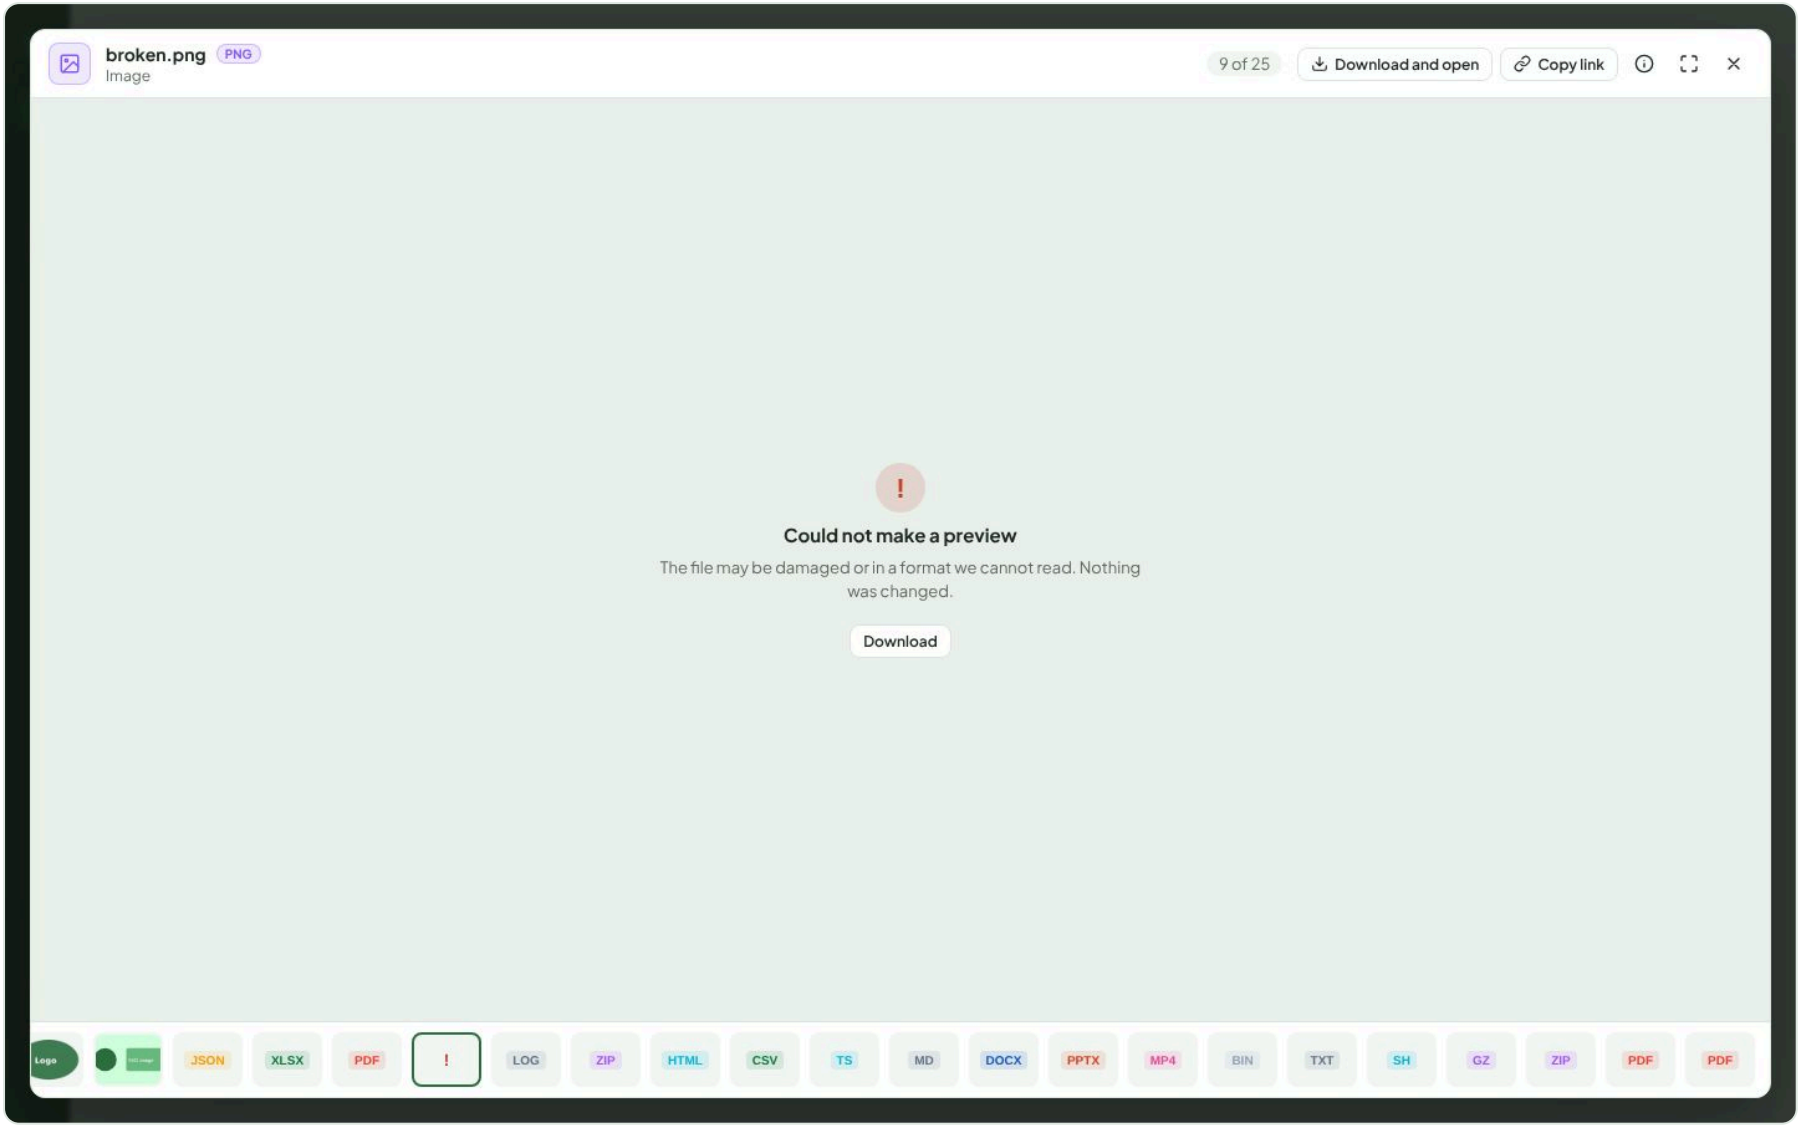

Looks like text but is binary

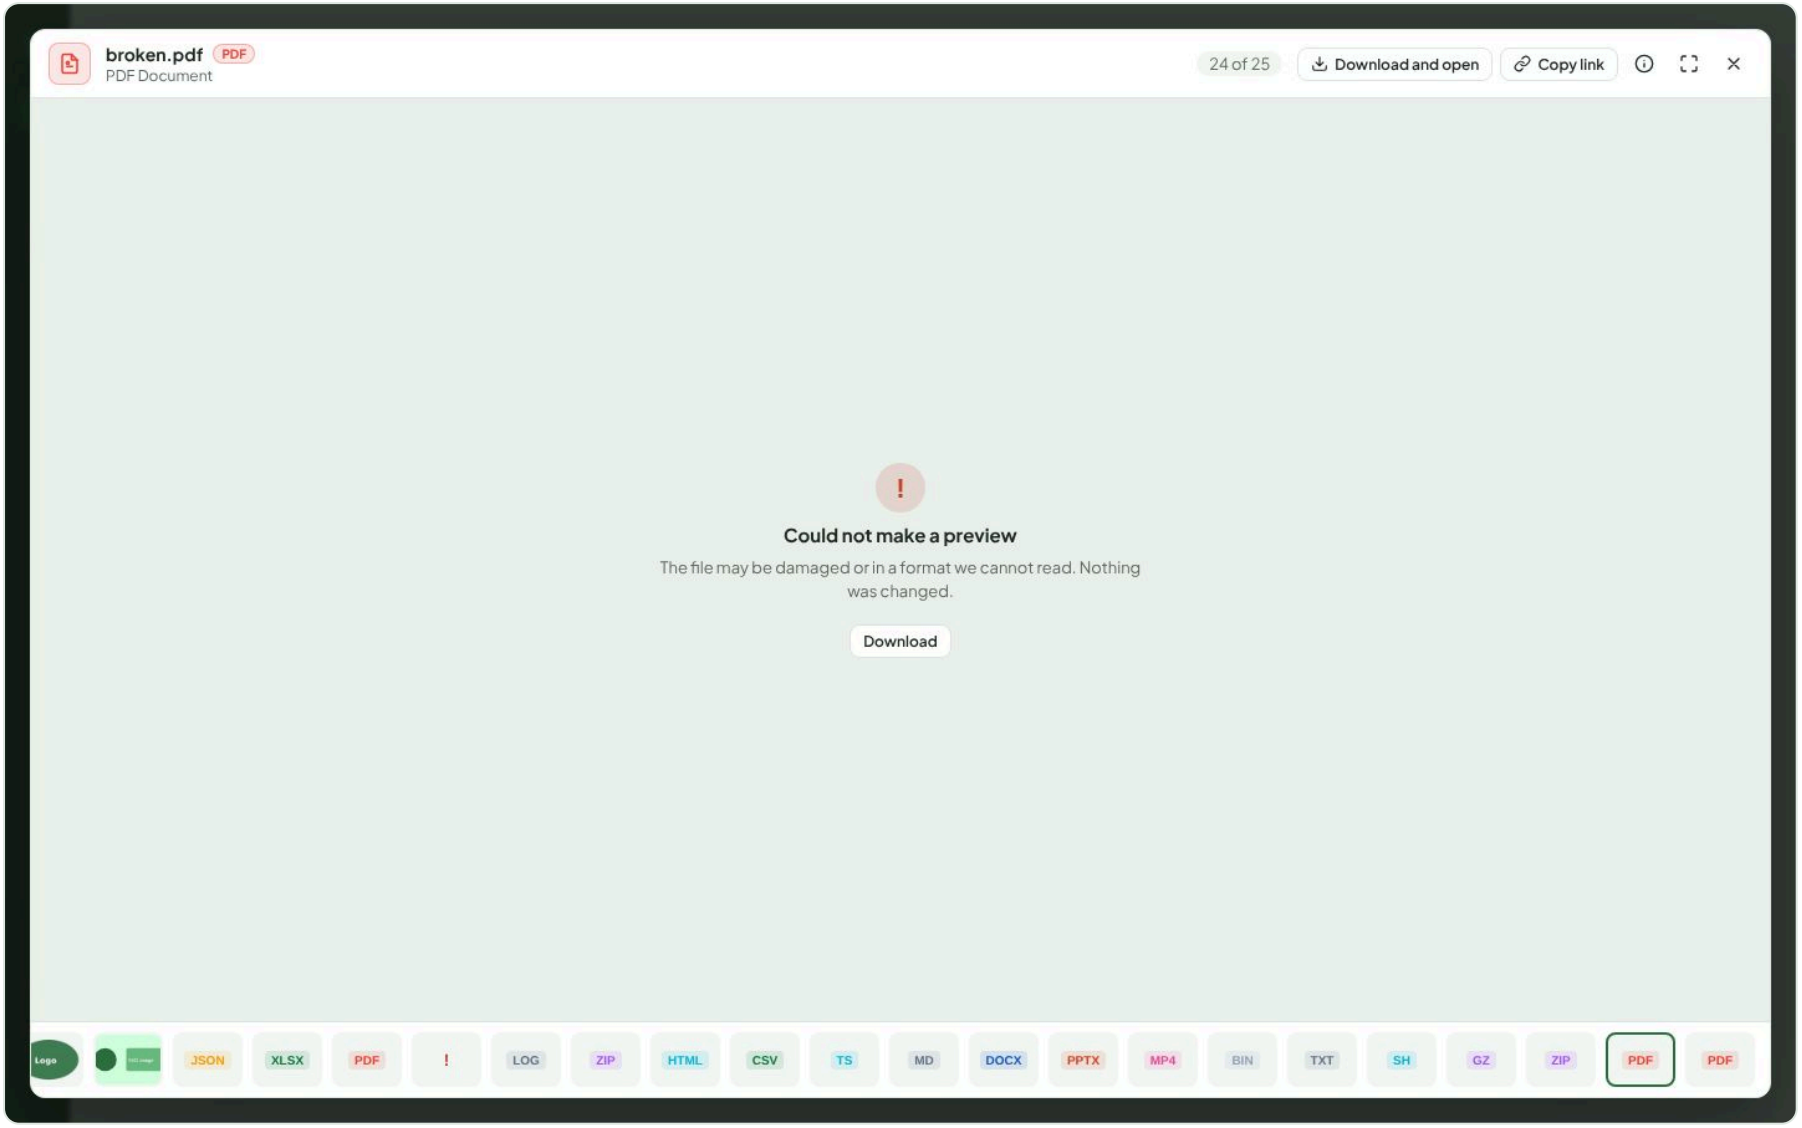

A damaged image

Each file explains itself when opened; next / previous never skip.

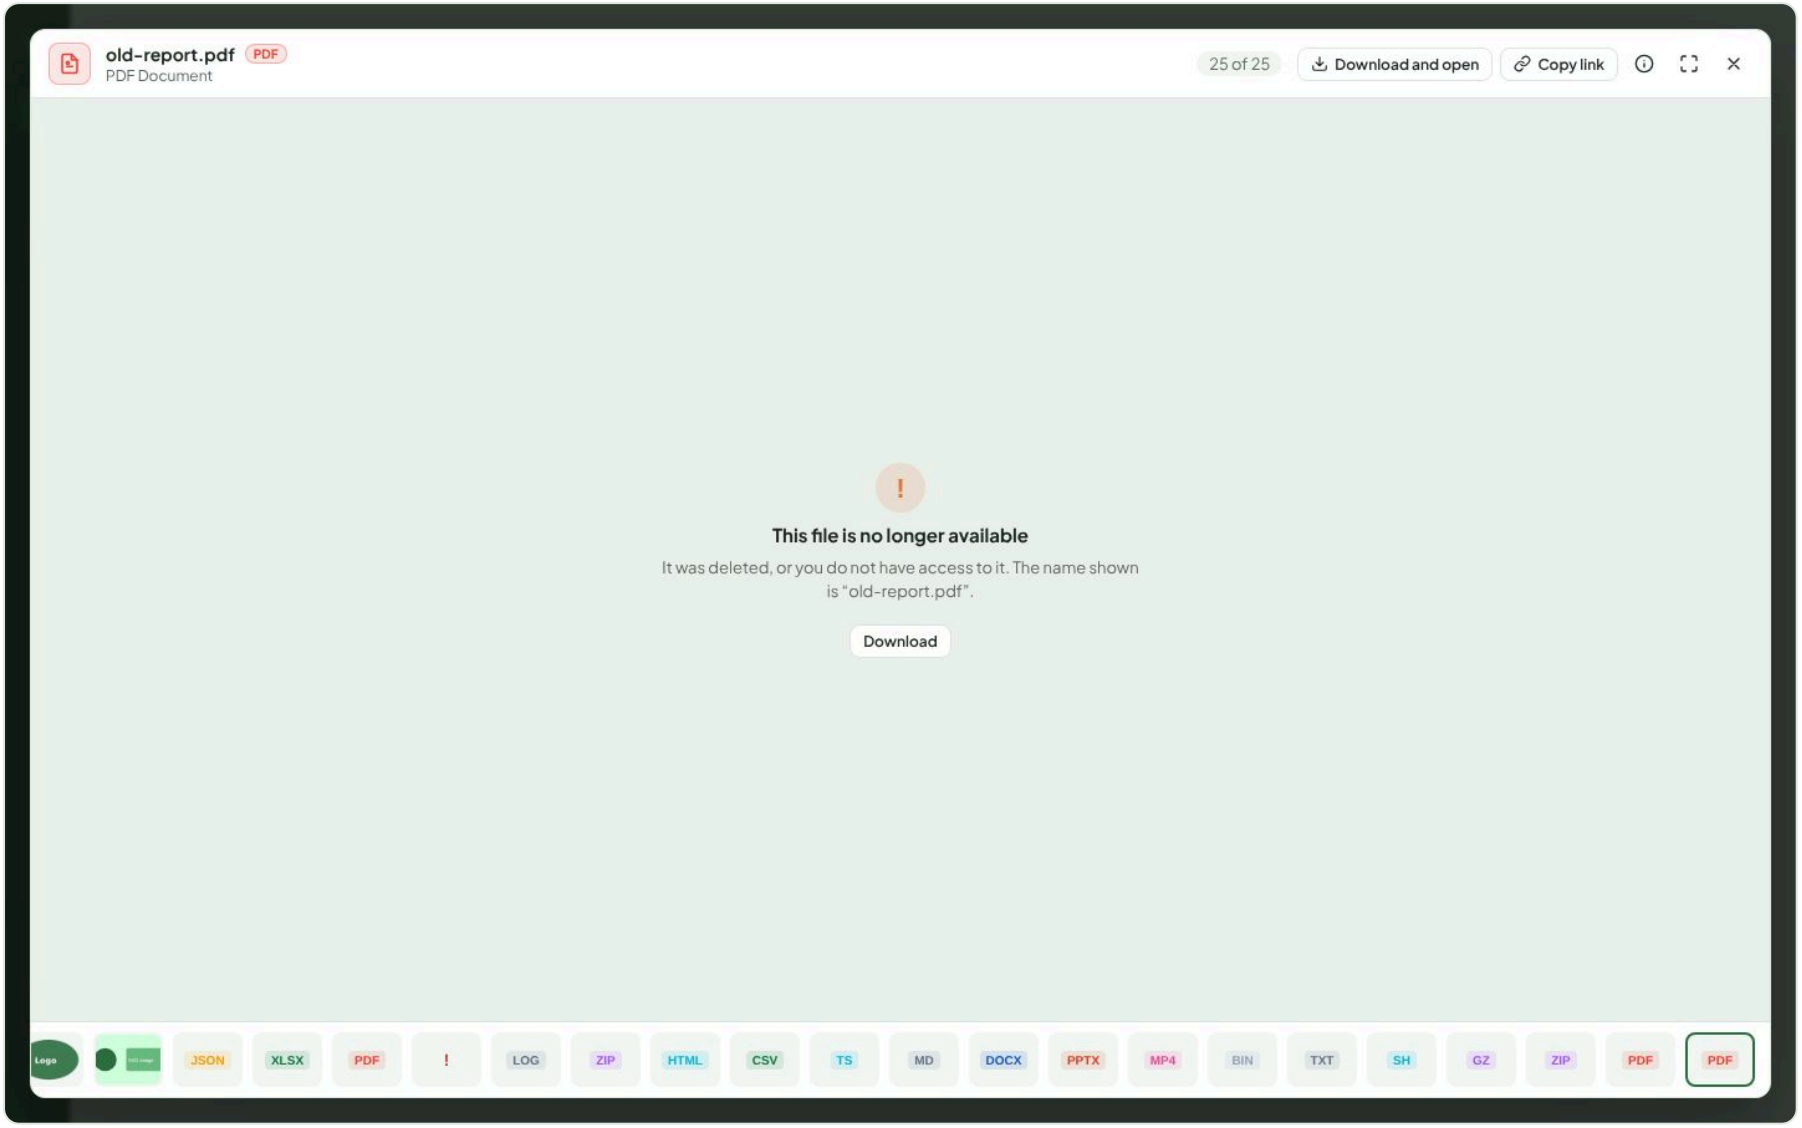

A damaged PDF

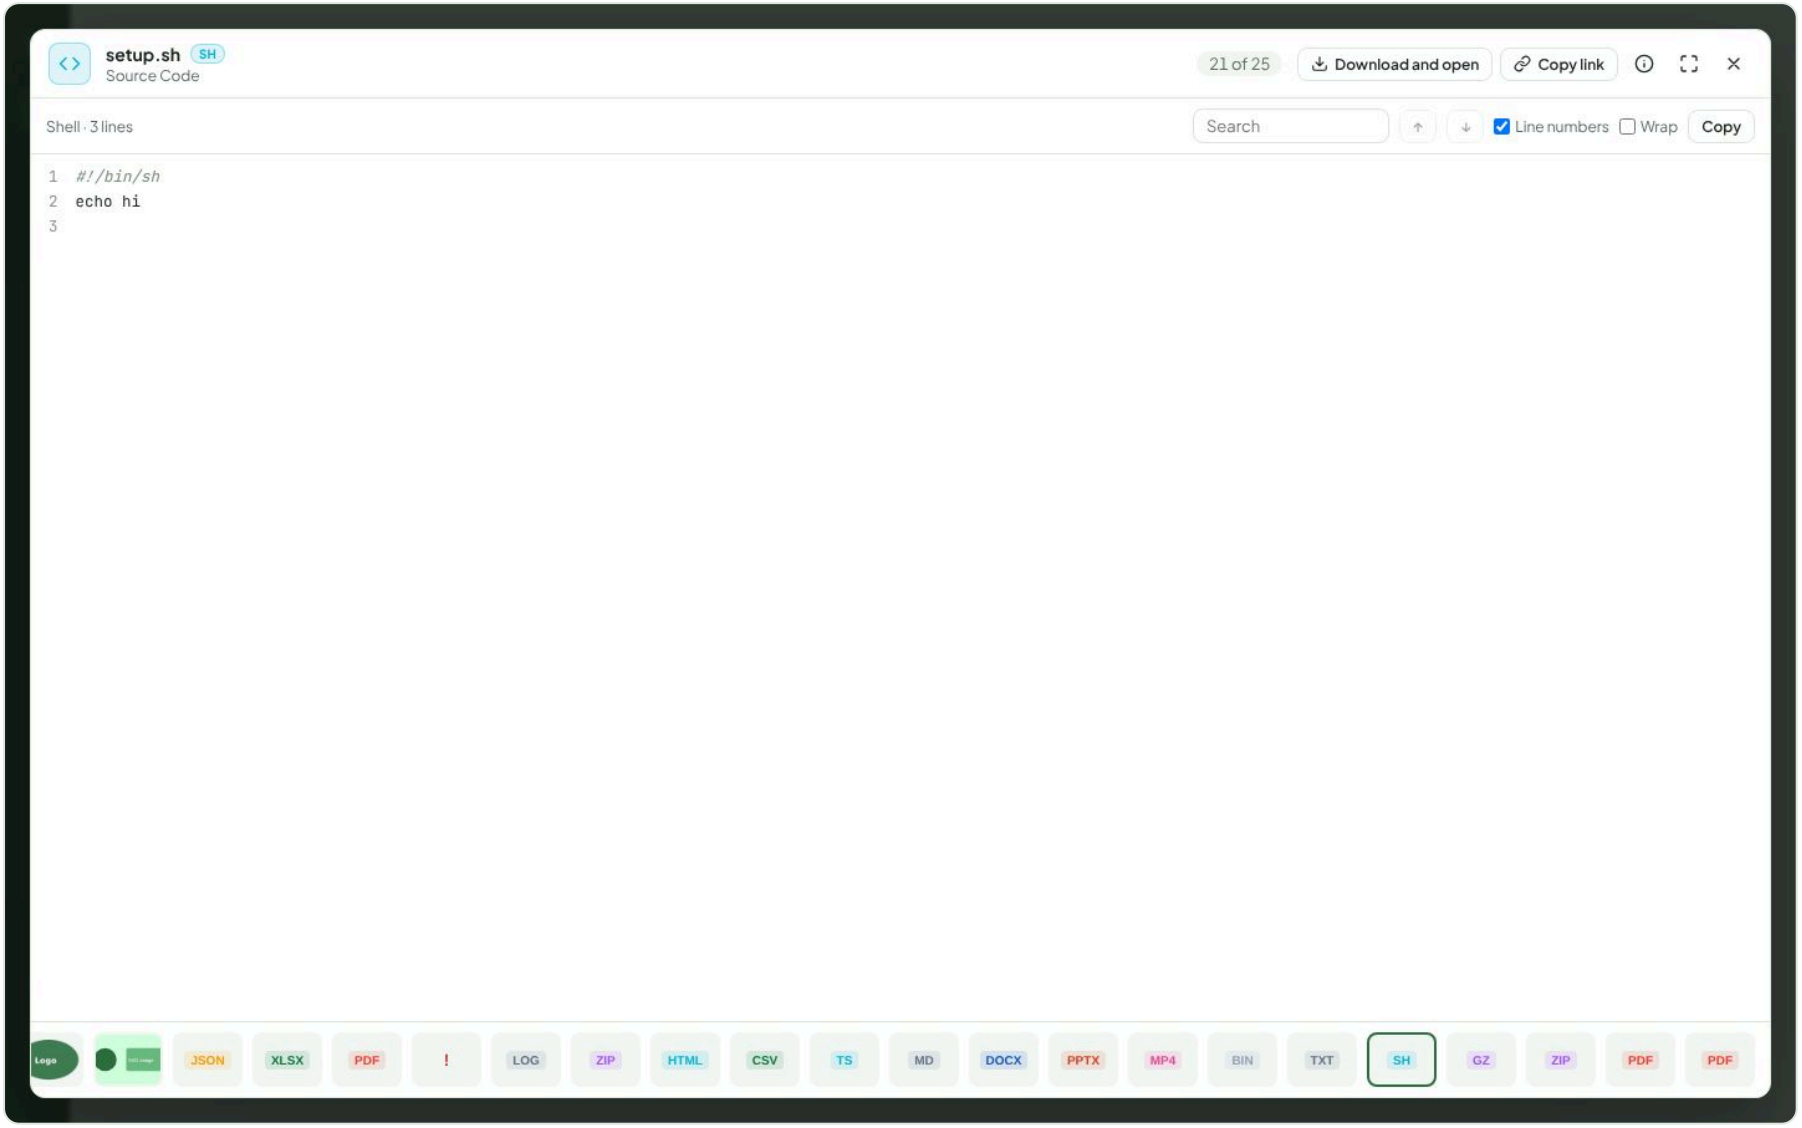

File missing or no access

The name is kept and Download stays.

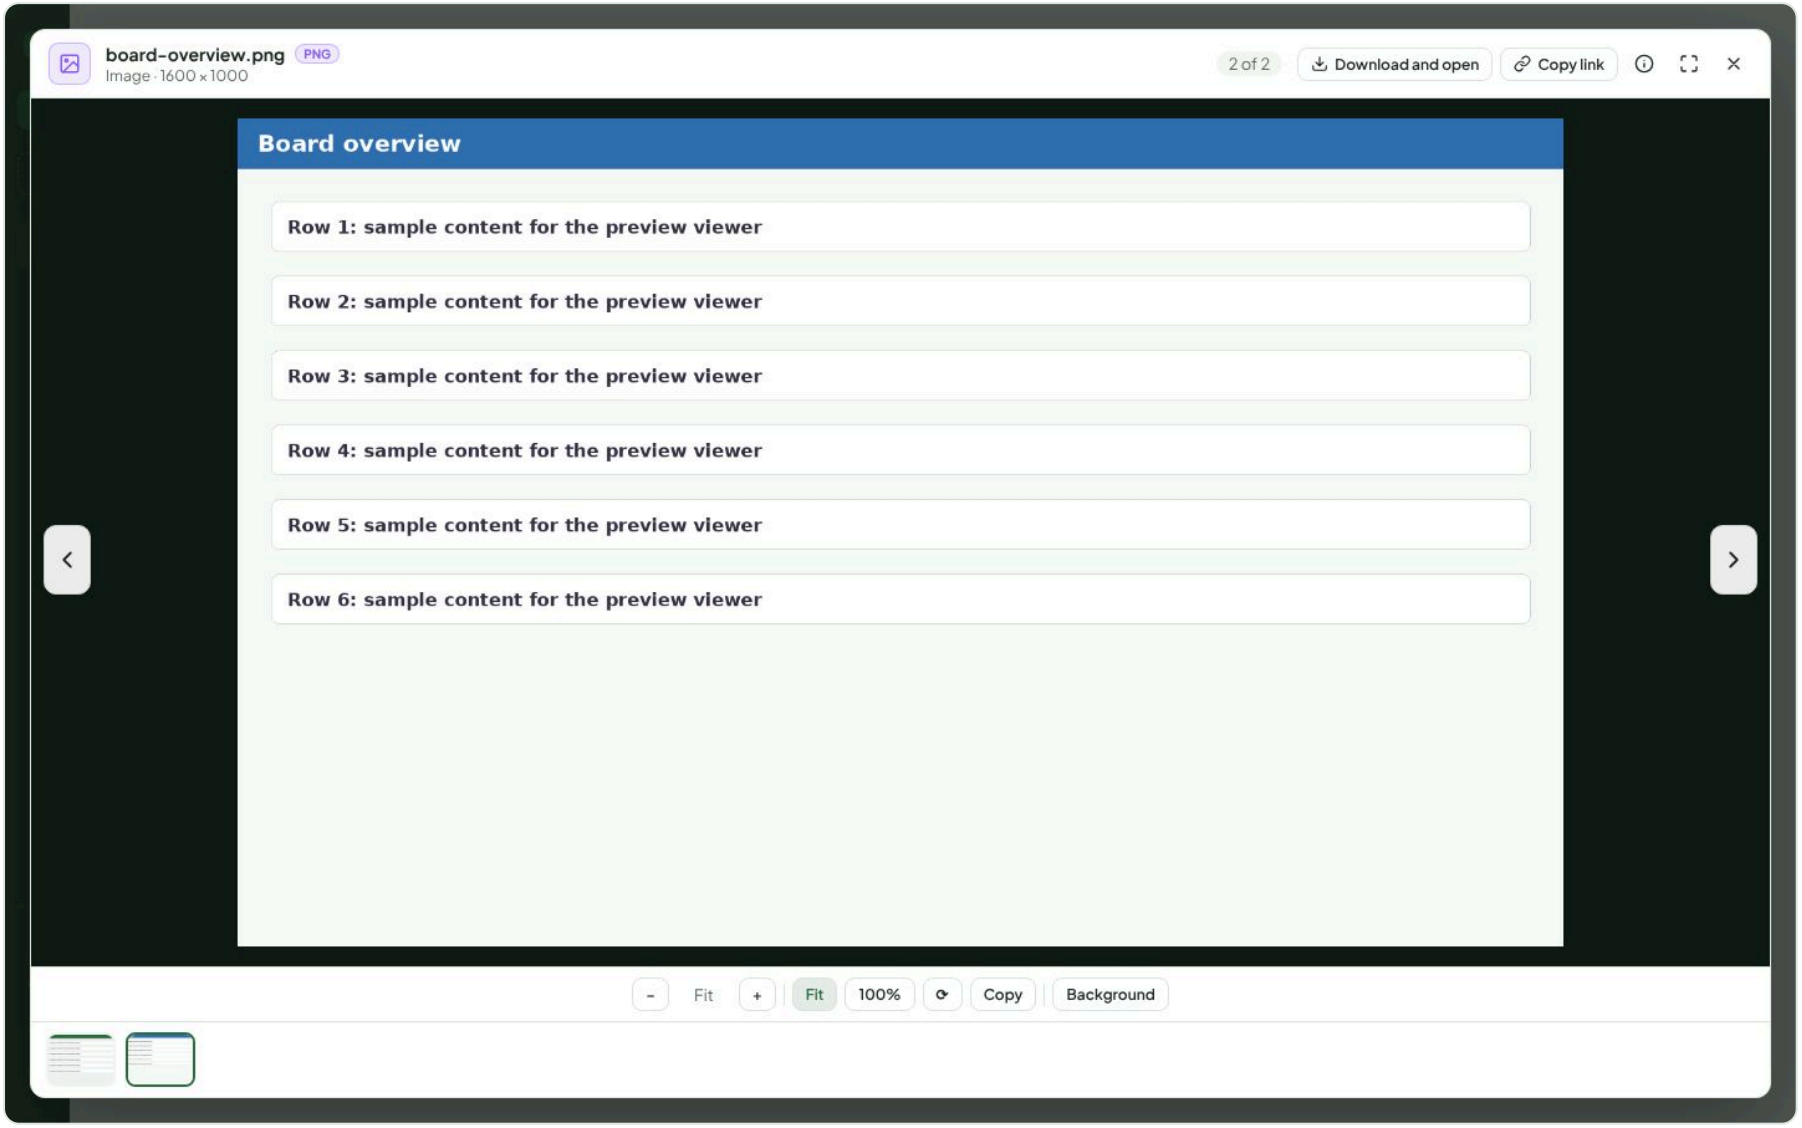

Scripts open as source

A .sh file is read as text; opening it in the default app (desktop) asks first.

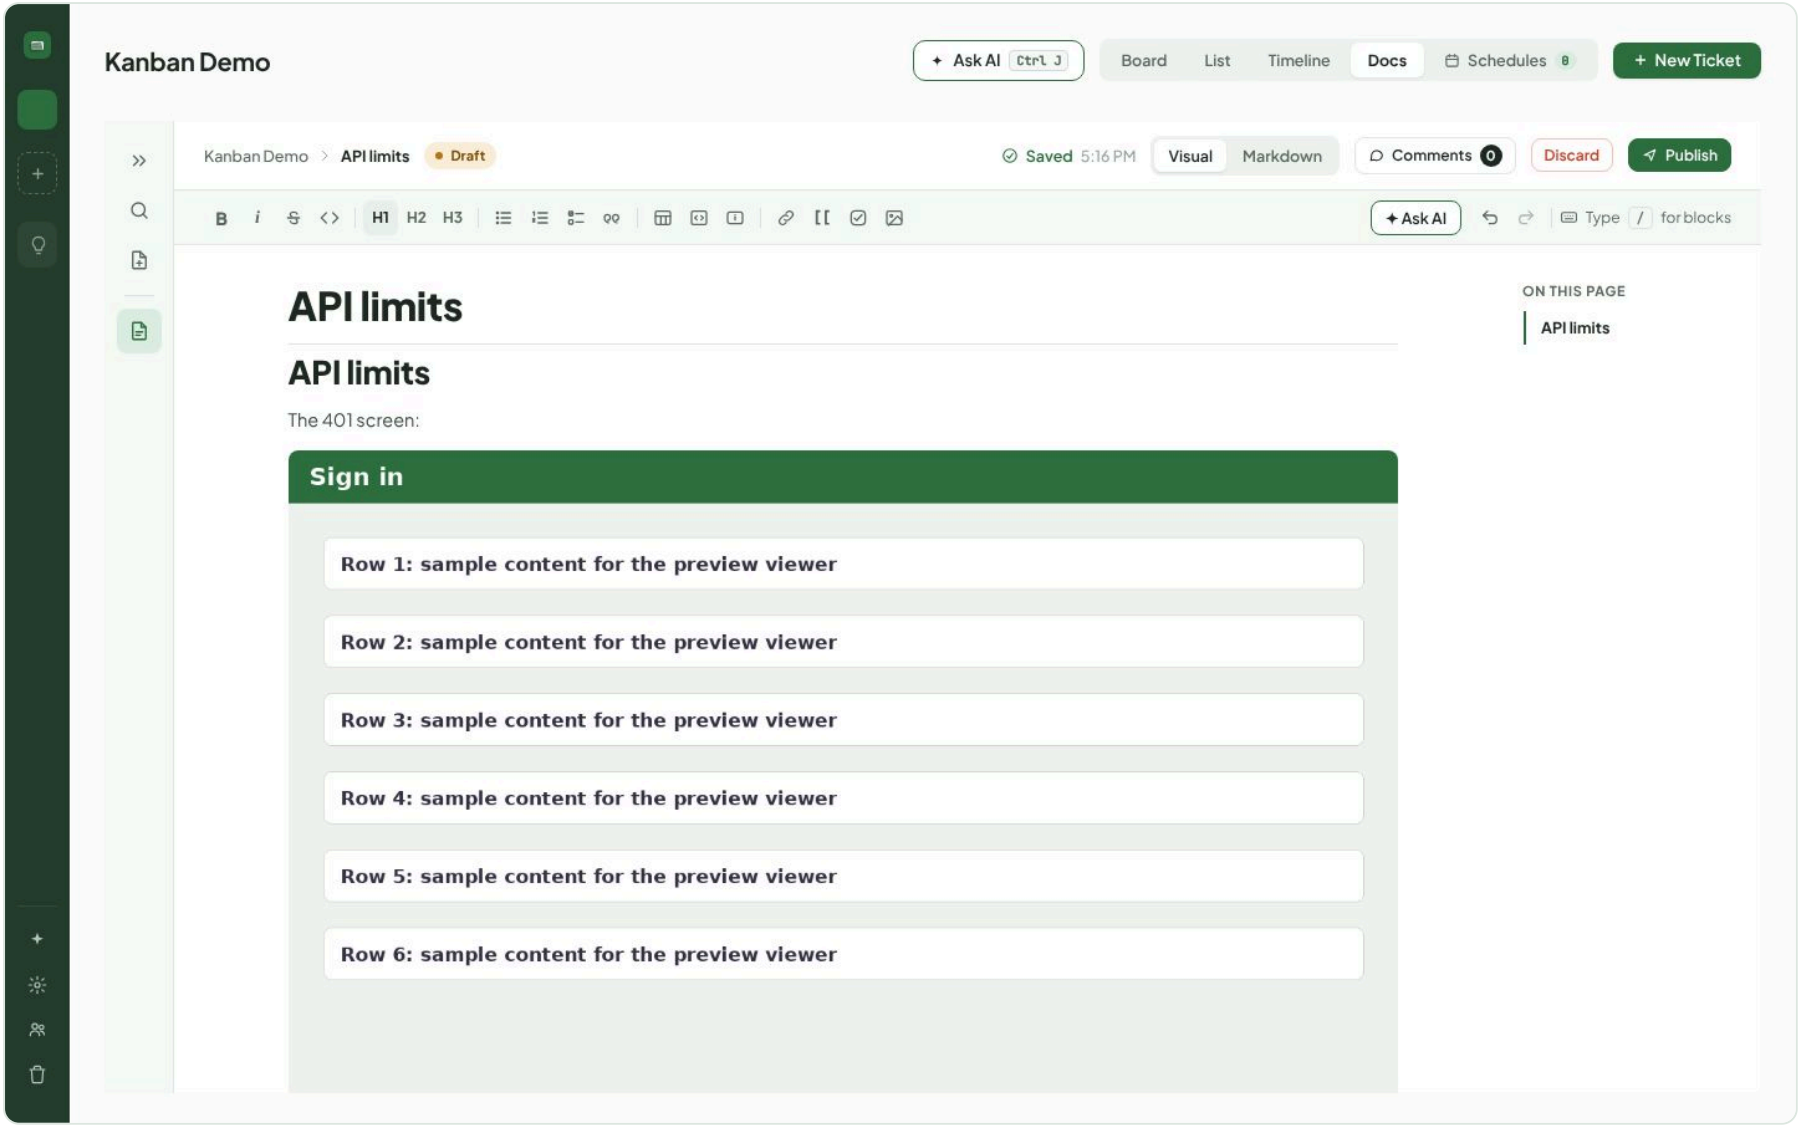

Docs images are clickable

Click an image in a Docs page; the other images of the page are its gallery. Enter and Space work on a focused image.

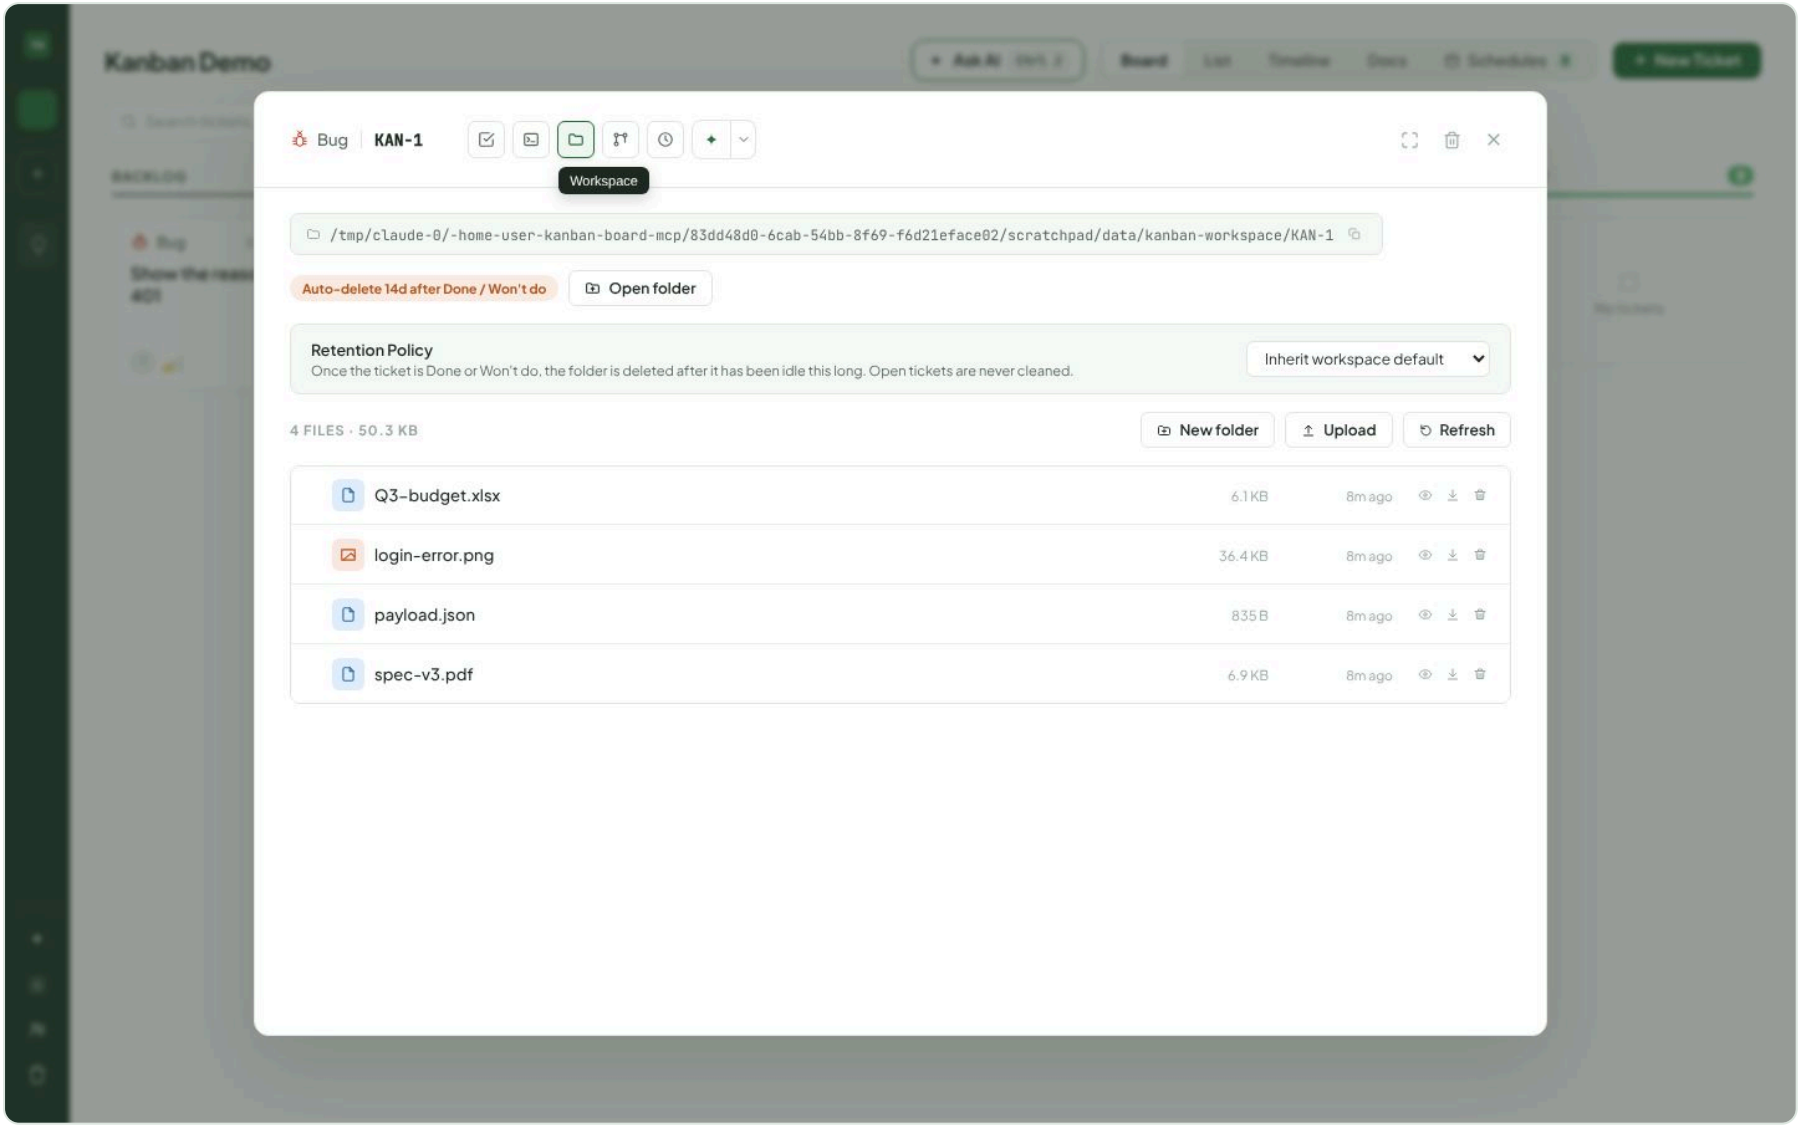

Docs editor

In the editor, double-click an image (or press Space on a selected one) to open it.

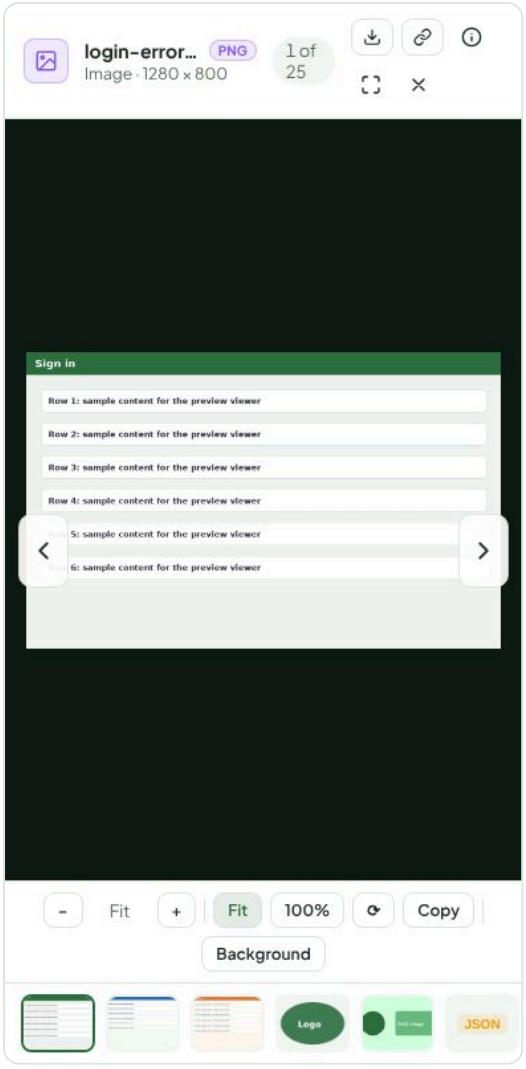

Ticket workspace

The workspace Preview button opens the same viewer with the other workspace files around it. The old side preview panel is gone.

Narrow screens

Same viewer, actions become icons, swipe moves between files.

How it was checked

The screenshots are from the real app (server + built UI) with files uploaded through the normal upload endpoint. Browser checks (Playwright) all passed:

- Opens at "1 of N"; ← → and thumbnails move; wheel zoom, + / −, 0, R, double-click, map, background menu; I opens and closes the details.
- Search in a log (3,427 matches counted), in a CSV and in a PDF (jumps to page 3); W toggles wrap; the first Esc clears a search, the next closes, and the ticket window behind stays open.
- Zip: folder browse and a file previewed inside; HTML: frame has an empty sandbox, no script in the document, a CSP, and zero requests to the outside hosts the page refers to.
- Docs: clicking an image opens a gallery of the page's images, Enter works, focus returns to the image on close; editor: double-click and Space; workspace: opens inside its own gallery.
- Server tests: an uploaded .html is never served as `text/html`; SVG carries the sandbox CSP. Desktop tests: every channel the page can call has a handler. Frontend prettier, eslint and the build pass.
